

OMNITUBE

OMNITUBE User Guide

Every screen and option explained with real screenshots, tips, costs, troubleshooting and the exact page to get each account key.

Version 1.5 · Windows and Mac

by Haris Ai · theharisai.com/omnitube

The same guide is inside the app: click How to use in the sidebar.

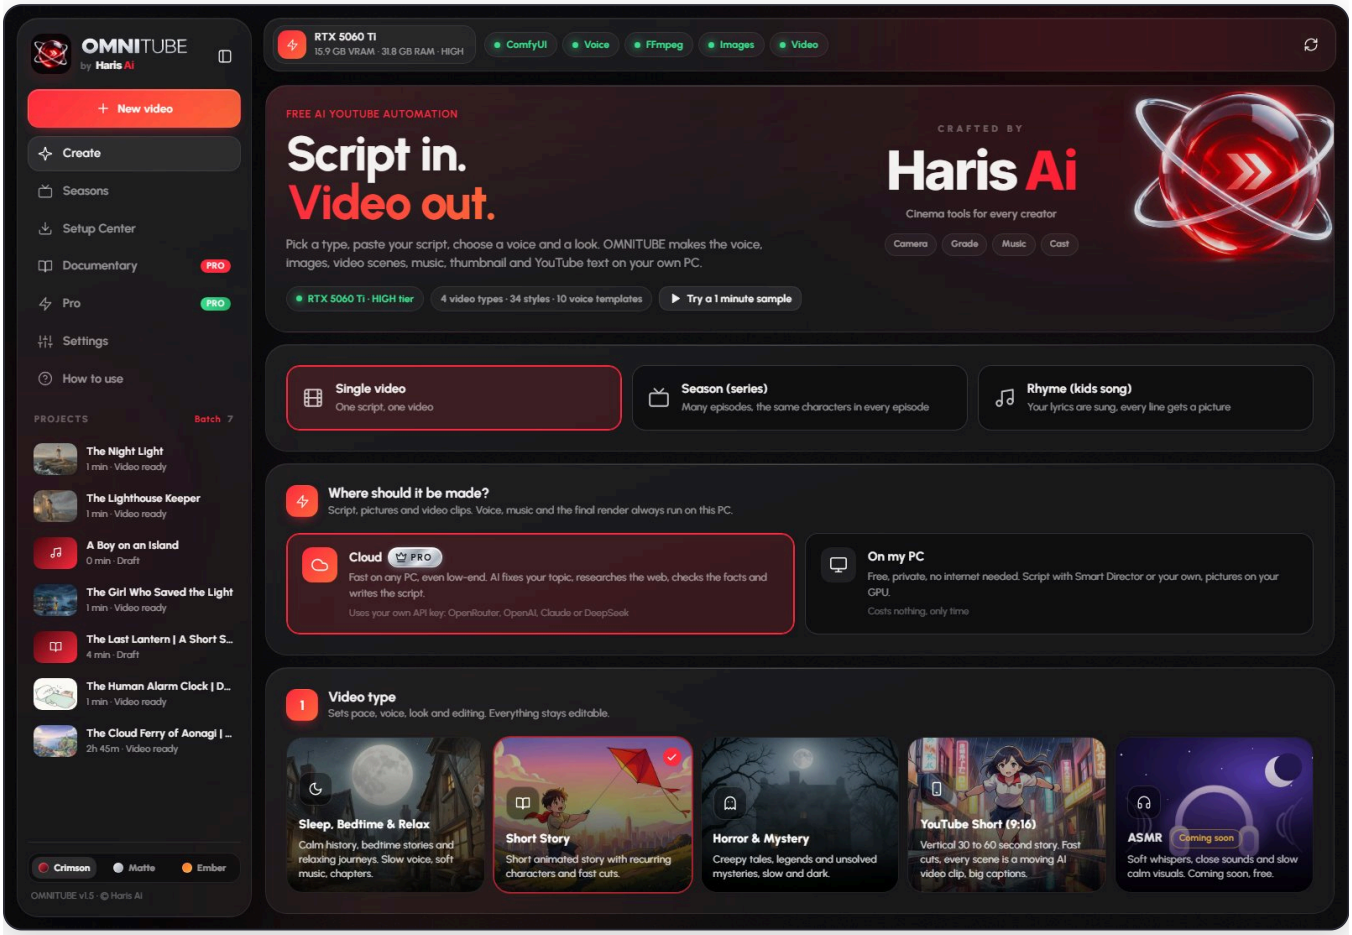

Contents

OMNITUBE turns a story or script into a finished YouTube video: picture prompts, pictures, video clips, narration, character voices, music, sound effects, captions, the edit, the render, thumbnails, titles, Shorts and dubbed versions. This guide follows the app screen by screen and uses the same button names you see in OMNITUBE. Click any topic to jump to it.

01

Getting started

The Create page: pick a video type, choose Cloud or On my PC, then paste your script.

What OMNITUBE is

OMNITUBE is a desktop AI video studio for Windows and Mac. You paste a script (or type a topic), pick a video type, and OMNITUBE makes everything else. Every part stays editable: you can change a single picture, a single voice line or the music of one chapter without starting over.

Free and Pro

Feature	Free	Pro
Where things are made	On your own PC	On your PC, or in the cloud on your own API keys
Pictures and video clips	Your NVIDIA graphics card (FLUX and Wan)	Cloud models such as Nano Banana, Seedream, Veo, Kling (or your GPU)
Voices	Kokoro, natural voices (Chatterbox), Microsoft Edge voices	Also Google Gemini, ElevenLabs, OpenAI and OpenRouter voices, voice cloning

Feature	Free	Pro
Music	ACE-Step on your GPU	Also Google Lyria and ElevenLabs
Extras	Captions, thumbnails, titles, Shorts, dubbing, Seasons	Also Timeline editor, Documentary Studio, cloud script writer, lip sync, 4K master, AI sound effects, Use OMNITUBE from Claude
Cost	Nothing. No subscription, no watermark, no minute limit	One license. You pay cloud providers directly. OMNITUBE has no credits and adds nothing on top

Pro is the same app with more power. Everything that is free stays free. Buy Pro at theharisai.gumroad.com/l/omnitube-pro. More information is on theharisai.com/omnitube.

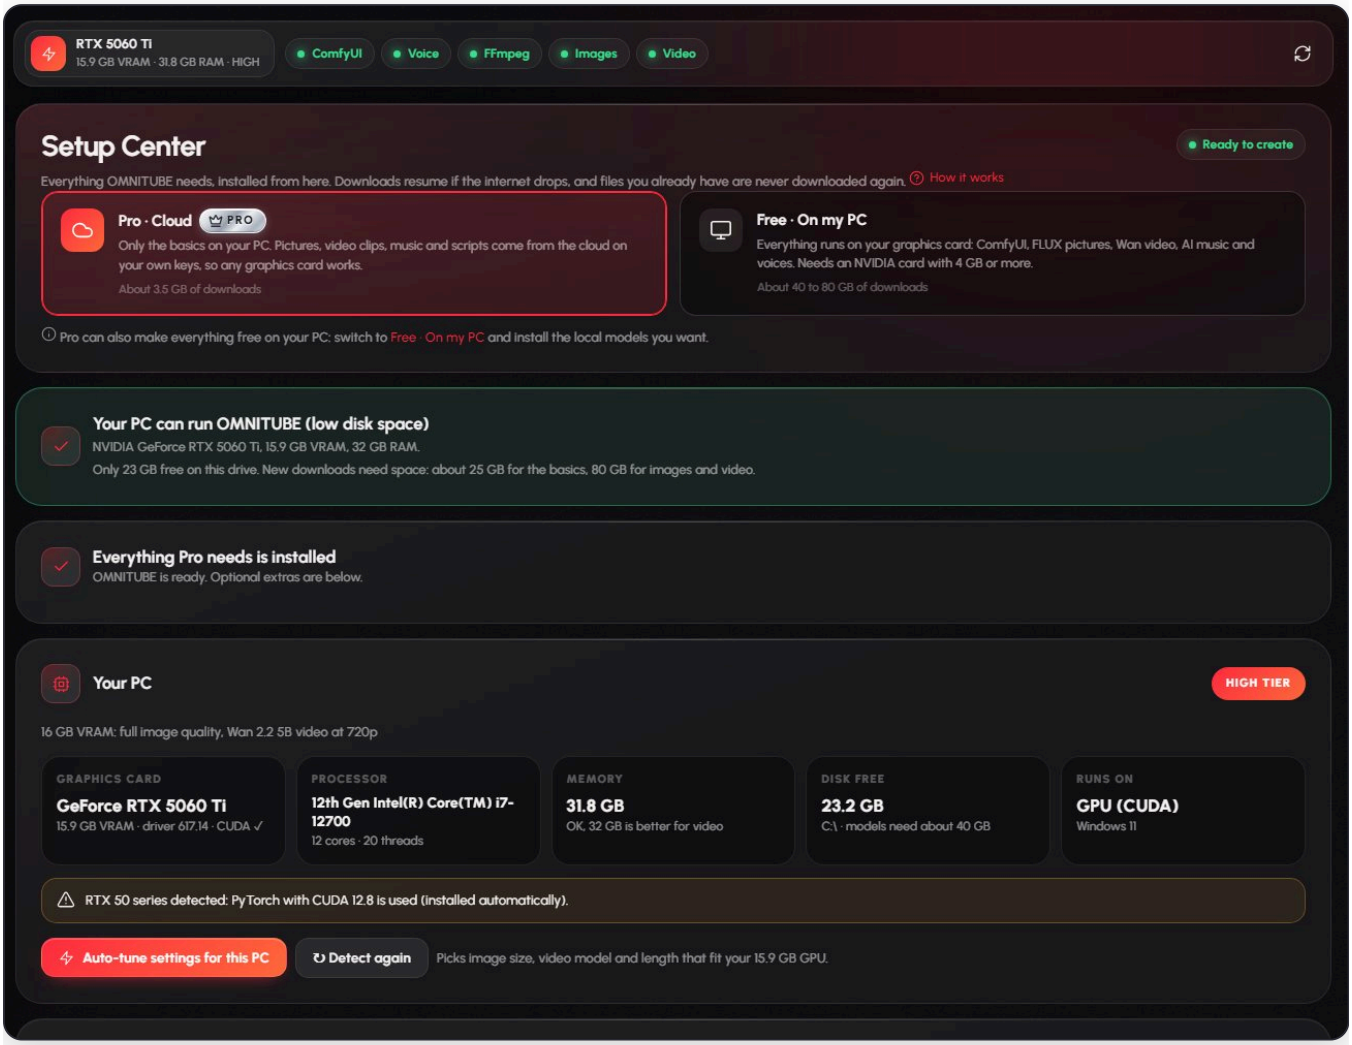

Quick start in 5 steps

1. Open **Setup Center** and click **Auto setup**. It installs everything that fits your PC (see Install).
2. Click **New video** in the sidebar. Pick **Single video**.
3. Pick a video type, for example **Short Story**, and paste your script into the **Script** box.
4. Click **Make my video**. OMNITUBE makes the voice, characters, places, pictures, music, sounds and the final video.
5. When it is done, the **Output** tab opens. Download the video, copy a title, download a thumbnail and upload.

> Tip: Not sure what OMNITUBE makes on your PC? On the **Create** page click **Try a 1 minute sample**. It builds a 1 minute story with 2 characters so you can see the full result before you write your own script.

02

Install and first start

Setup Center checks your PC and installs everything OMNITUBE needs.

Windows

1. Download OMNITUBE from theharisai.com/omnitube and install it.
2. Start OMNITUBE. The launcher installs the Microsoft Visual C++ Runtime by itself if your PC does not have it. If Windows asks for permission, click **Yes**.
3. The first time, OMNITUBE opens **Setup Center** with the message to install the Core items once.
4. Click **Auto setup**. OMNITUBE picks the items that fit your PC, shows the total size and a time estimate, and downloads them one after another.

You can keep using the app while it downloads. Downloads resume after an internet drop, and files you already have are never downloaded again.

> Tip: The free setup on a PC with an NVIDIA card is about 40 to 80 GB of downloads. Check **Disk free** on the **Your PC** card first. If the drive is too small, Setup Center warns you before it starts.

What your PC needs for Free

- An NVIDIA graphics card with 4 GB or more for pictures and video clips. RTX 20 to RTX 50 cards are supported. RTX 50 cards need NVIDIA driver 570 or newer.
- 16 GB of system memory for video clips, music and Smart Director. 32 GB is better for video.
- Wan 2.2 14B FAST (better motion) needs 32 GB of system memory.

No NVIDIA card? OMNITUBE still runs. Voice, music editing and rendering work on any PC, and with Pro the pictures and clips are made in the cloud. The **Storyboard** shows a **Switch to Cloud** button when your PC has no NVIDIA card.

Setup Center basics

At the top of **Setup Center** you choose how you want to work:

- **Free · On my PC**: everything runs on your graphics card (ComfyUI, FLUX pictures, Wan video, AI music and voices).
- **Pro · Cloud**: only the basics go on your PC (about 3.5 GB). Pictures, video clips, music and scripts come from the cloud on your own keys, so any graphics card works.

Pro users can still install the local models: switch back to **Free · On my PC** and install what you want. See Setup Center for every card.

Mac

- OMNITUBE needs an Apple Silicon Mac (M1 or newer) with macOS 12 or later.
- On a Mac, making pictures and video clips on the computer itself is switched off by design. Pictures and clips are made in the cloud with Pro, or you use stock footage. The Mac does the voice, editing and rendering.
- Setup Center on a Mac does not show the Windows essentials (Visual C++, WebView2, NVIDIA driver). The AI engine for Apple Silicon is about 1 GB.
- Cloud voices and Edge voices work on a Mac without any extra install. OpenRouter voices are a good choice because nothing has to be installed.
- To quit OMNITUBE fully on a Mac, press Cmd+Q.

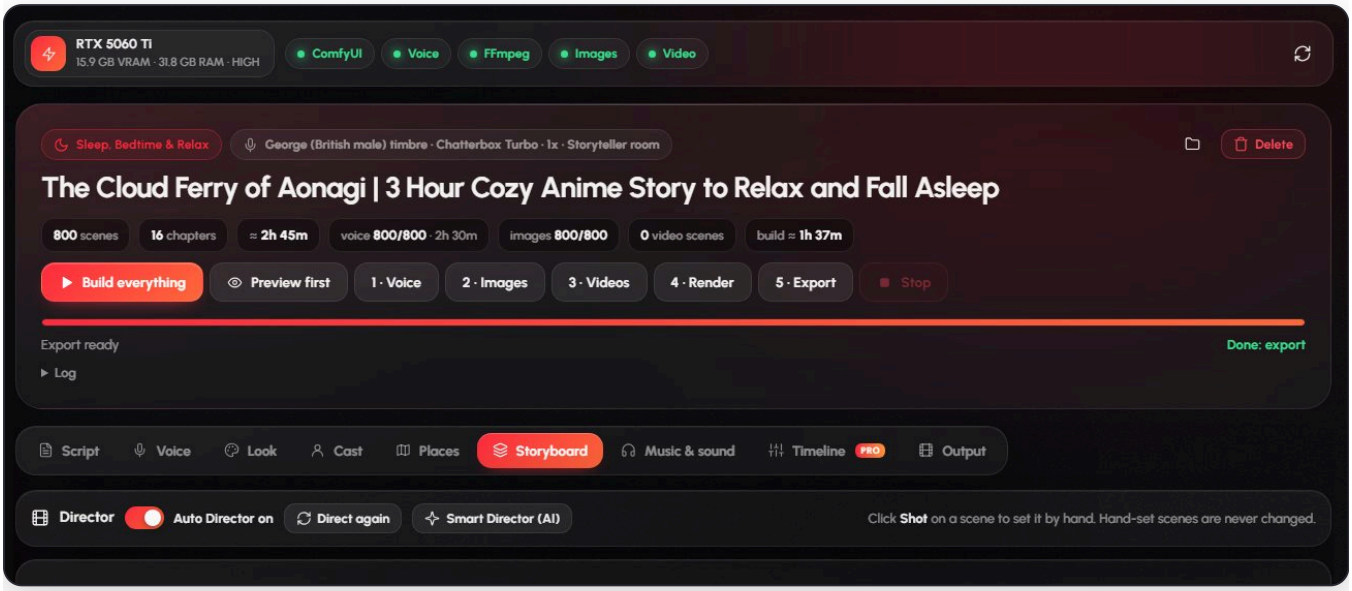

Updates

The update button sits in the top bar. It shows **Check for updates**, **Update to v...** when a new version is out, or **Restart to update** when it is downloaded. Updates download only the changed app files. Projects, models and settings stay as they are.

> Warning: If OMNITUBE says an update is required, Pro features are paused until you update. Your projects are safe.

03

Make your first video

A finished project: a 2 hour 45 minute sleep story with 800 scenes, voiced and pictured.

1. Start a new video

Click **New video** in the sidebar (or **Create**). At the top choose a mode:

- **Single video**: one script, one video.
- **Season (series)**: many episodes with the same characters. See Seasons.
- **Rhyme (kids song)**: your lyrics are sung and every line gets a picture. See Kids rhyme.

2. Choose where it is made

For a single video, the card **Where should it be made?** has two choices:

- **On my PC**: free, private, no internet needed. You write the script yourself or let the Smart Director help. Pictures are made on your GPU.
- **Cloud** (PRO): fast on any PC. The AI fixes your topic, researches the web, checks the facts and writes the script on your own key.

Voice, music and the final render always run on your PC.

3. Pick a video type

The video type sets the pace, voice, look and editing. Everything stays editable later. See Video types.

4. Write or paste the script

Fill in **Video title** and **Thumbnail text** (both optional), then paste your script into **Script**. Under the box OMNITUBE shows the word count, the narration length and how many images it will make.

No script yet? With **On my PC** you can open **Write a doodle explainer script with AI**, type what the video is about and the minutes, and click **Write it**. With **Cloud** you use the cloud script writer (see below).

5. Build

- **Make my video**: everything automatic, start to finish.
- **Review scenes first**: opens the Storyboard so you can check or change any scene, then press **Build everything**.

The voice and the look start from the video type (or from your default style in My styles). You change them on the **Voice** and **Look** tabs of the project.

6. Watch the build

The project page shows the steps **1 · Voice**, **2 · Images**, **3 · Videos**, **4 · Render** and **5 · Export**, a progress bar, a status line and a **Log**. The scene counters show how many voices and images are done. After your first build OMNITUBE learns how fast your PC is and shows **build ≈** with a time estimate.

You can click **Stop** at any time. The current image or clip finishes first. Click **Resume** later: finished voices, images and clips are kept.

> Tip: Before a long video, click **Preview first**. It makes the voice, the images and a short render of the first 3 scenes so you can check the look, voice and captions.

The cloud script writer (Pro)

When you pick **Cloud**, a **Cloud script writer** appears in the Script card.

1. Under **Script AI** pick a provider (for example OpenRouter, OpenAI, Claude or DeepSeek), paste your key and click **Connect**. The key is saved encrypted on this PC only.
2. Pick a model. OMNITUBE suggests a **Budget** and a **Best quality** model and shows what one script costs at 1, 5, 10 and 15 minutes. **Your own model** lets you search all models.
3. Type **What is your video about?** and the **Minutes**, then click **Next: plan research**. Spelling mistakes are fine; OMNITUBE fixes them and shows **keep mine** if you prefer your spelling.
4. Choose **Real facts** (OMNITUBE researches the web) or **Made-up story**.
5. Tick the **Research directions** (or story directions) you want, add your own, and fill **Must include** if needed.
6. Click **Research & write the script** or **Write the story**. You see the steps Research, Facts, Writing and Fact check.

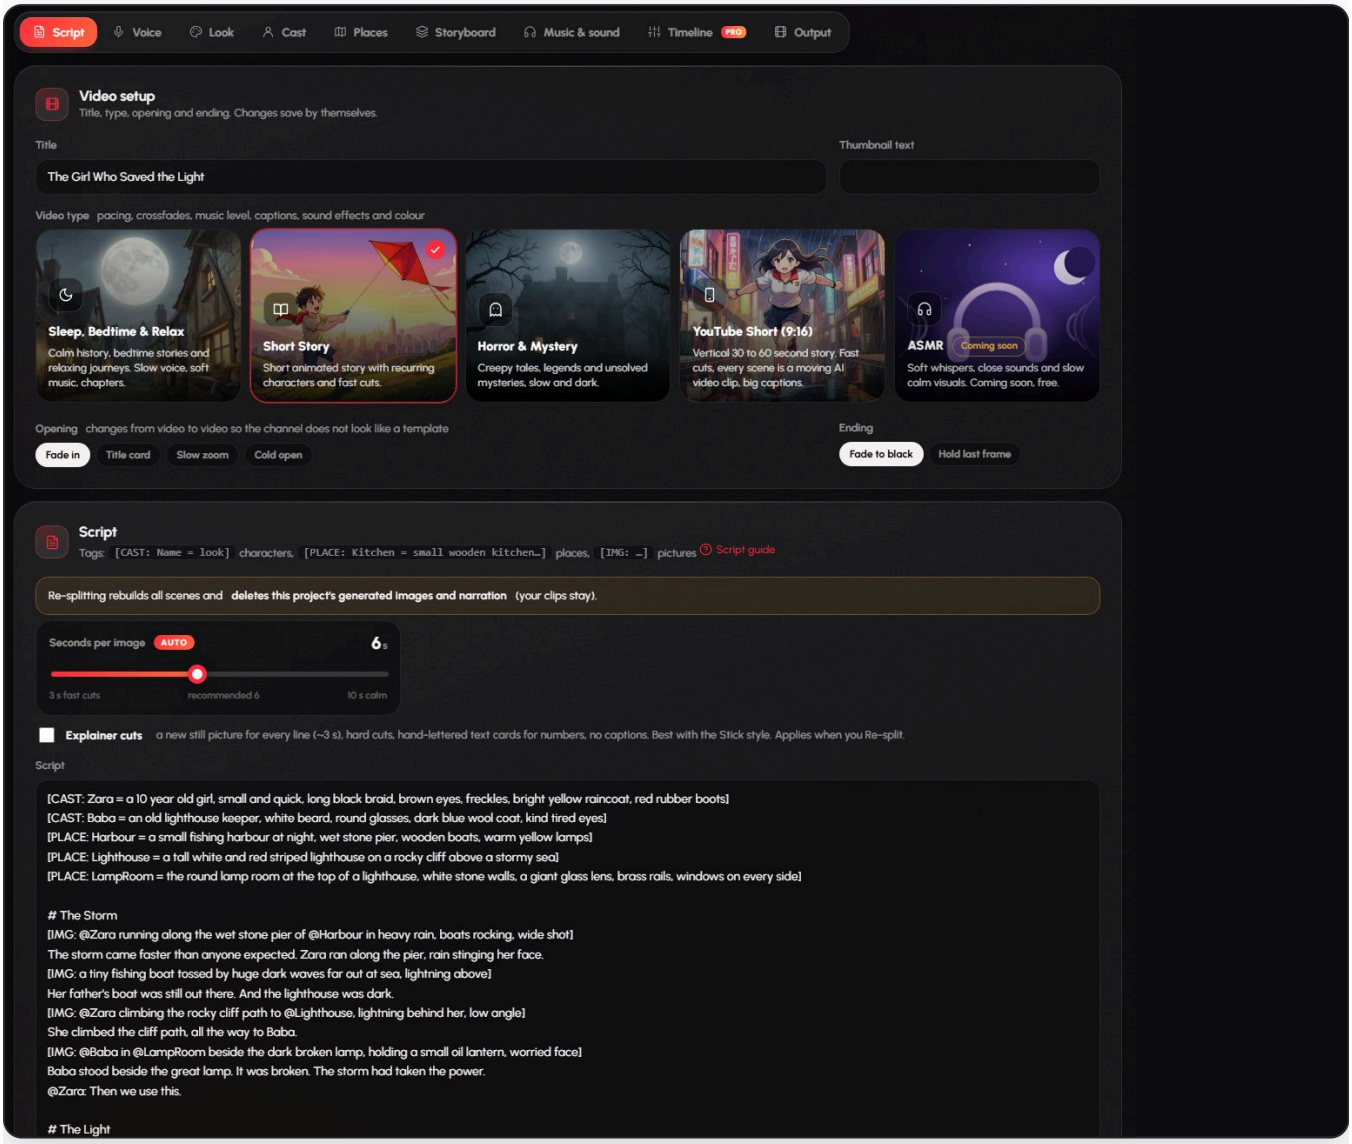

When it is done you see how many facts were found, how many were confirmed by 2 or more websites, and the sources. Read the script once and change anything you like.

Common mistakes

- Pressing **Make my video** before Setup Center shows **Ready to create**. OMNITUBE then shows "A few things are still missing" with an **Install now** button.
- Writing a character's spoken line in the middle of a paragraph. The narrator reads it. See Script format.

04

Script format

The Script tab: title, video type, opening and ending, then the script with [CAST], [PLACE] and [IMG] tags.

A script is plain text. Every normal line is read by the narrator, and OMNITUBE splits the text into scenes by itself. Tags are optional and each tag goes on its own line.

The tags

Write this	What it does
`# Chapter title`	Starts a new chapter. A line like `Chapter 2: The Storm` works too.
`[IMG: what to draw]`	The picture for the lines below it. `[IMAGE: ...]` and `[VISUAL: ...]` also work. Without it OMNITUBE writes the picture prompts.

Write this	What it does
`[CAST: Mira = a 10 year old girl, curly black hair, yellow raincoat]`	A character, drawn the same in every scene.
`[PLACE: Kitchen = a small wooden kitchen, round window, warm lamp light]`	A place, drawn the same in every scene that happens there.
`@Mira: Where are you going?`	Mira's own spoken line, in her own voice.
`@Mira` inside an `[IMG: ...]`	Puts that character in the picture.
`[TITLE: ...]` and `[THUMBNAIL: ...]`	Fill the video title and thumbnail text. These lines are never read aloud.

Character dialogue

A character's line must be **on its own line** and start with `@Name:`. The name must match a `[CAST: ...]` character (or a character on the Cast tab). The first name is enough. Written anywhere else, the narrator reads it.

```
The night was quiet in the village.
@Mira: Where are you going so late?
@Leo: To find the lost lantern.
Mira watched him walk into the dark.
```

Inside a scene's text the same line shows as `[Mira] Where are you going so late?`. The **Dialogue** card on the Voice tab warns you when a speaking name has no character on the Cast page.

Length

- About 150 narrated words make 1 minute of video.
- A slower voice speed makes the video longer. The estimate under the script box follows the speed.
- Each picture stays on screen between 3 and 10 seconds. You set this with **Seconds per image**.

A full example script

Copy it into the Script box as it is, then change the story to yours.

```
[TITLE: The Lantern Keeper, A Cozy Story]
[THUMBNAIL: The Lost Lantern]
[CAST: Mira = a 10 year old girl, curly black hair, yellow raincoat]
[CAST: Leo = a 12 year old boy, short brown hair, green wool sweater]
[PLACE: Workshop = a small stone workshop, wooden shelves full of old lanterns, warm candle
light]

# The Quiet Village
[IMG: a small fishing village at dusk, fog over the harbour, warm window lights]
Every evening the fog came in from the sea. The villagers lit their lanterns and went home
early. Only one lantern was missing: the old one from the lighthouse.

# The Workshop
[IMG: @Mira and @Leo in the Workshop, looking at an empty hook on the wall]
Mira found Leo in the workshop, staring at the empty hook.
@Mira: Where are you going so late?
@Leo: To find the lost lantern.
Mira watched him walk into the dark, then she grabbed her coat and followed.
```

Bring in many scripts at once (batch)

Click **Batch** next to **Projects** in the sidebar. The **Batch build** window has two parts:

- **Import many scripts at once**: pick .txt files (one video each, the file name becomes the title), or one .csv or .json file with `title` and `script` columns. Up to 200. Choose the video type and tick **Build them right away** if you want them queued at once. Click **Choose files**.
- **Build selected**: tick projects that already exist and build them one after another, for example overnight. Only missing parts are made.

> Tip: Your PC must stay on during a batch. Start with 2 or 3 videos to check the settings before you queue 50.

Script tab tools

Inside a project the **Script** tab has:

- **Video setup**: Title, Thumbnail text, Video type, **Opening** (**Fade in**, **Title card**, **Slow zoom**, **Cold open**) and **Ending** (**Fade to black**, **Hold last frame**). Changes save by themselves. Vary the opening so the channel does not look like a template.
- **Seconds per image** and **Explainer cuts** (a new still picture for every line, about 3 s, hard cuts, hand-lettered text cards for numbers, no captions; best with the Stick style).
- **Improve script**: makes weak writing stronger while the story, names, order of events and ending stay the same. You see the new version first, then **Use it and re-split** or **Put it in the editor**.
- **Re-split script**: rebuilds all scenes from the text.
- **Hook Doctor**: scores the first 30 seconds out of 10 and suggests better opening lines (**Replace first line** or **Add before**). **Check on this PC** is free with Smart Director; **Check in the cloud** is Pro.
- **Originality check**: compares the script with your other videos and gives a score out of 100. YouTube does not pay for mass-produced, templated content.

Warning: **Re-split script** deletes this project's generated images and narration (your own clips stay). Make text changes first, then re-split once.

05

Video types

The video type sets pacing, crossfades, music level, captions, sound effects, colour, the recommended voice, speed and style. You can change any of these afterwards.

Video type	Best for	Defaults
Sleep, Bedtime & Relax	Calm history, bedtime stories, relaxing journeys	Slow deep voice, soft music, chapters, Soft painterly style
Short Story	Short animated stories with recurring characters	Fast cuts, Anime classic style
Horror & Mystery	Creepy tales, legends, unsolved mysteries	Slow and dark, Horror cinematic style
YouTube Short (9:16)	Vertical 30 to 60 second stories	Every scene is a moving AI video clip, big captions

- **Kids Rhyme (song)** has its own mode on the Create page. See Kids rhyme.
- Documentaries are made in the Pro Documentary Studio.
- An **ASMR** card shows as **Coming soon**.

> Tip: To change the type of an existing video, open the **Script** tab and pick a new card under **Video type**. Pacing, music and captions follow it.

06

Kids rhyme

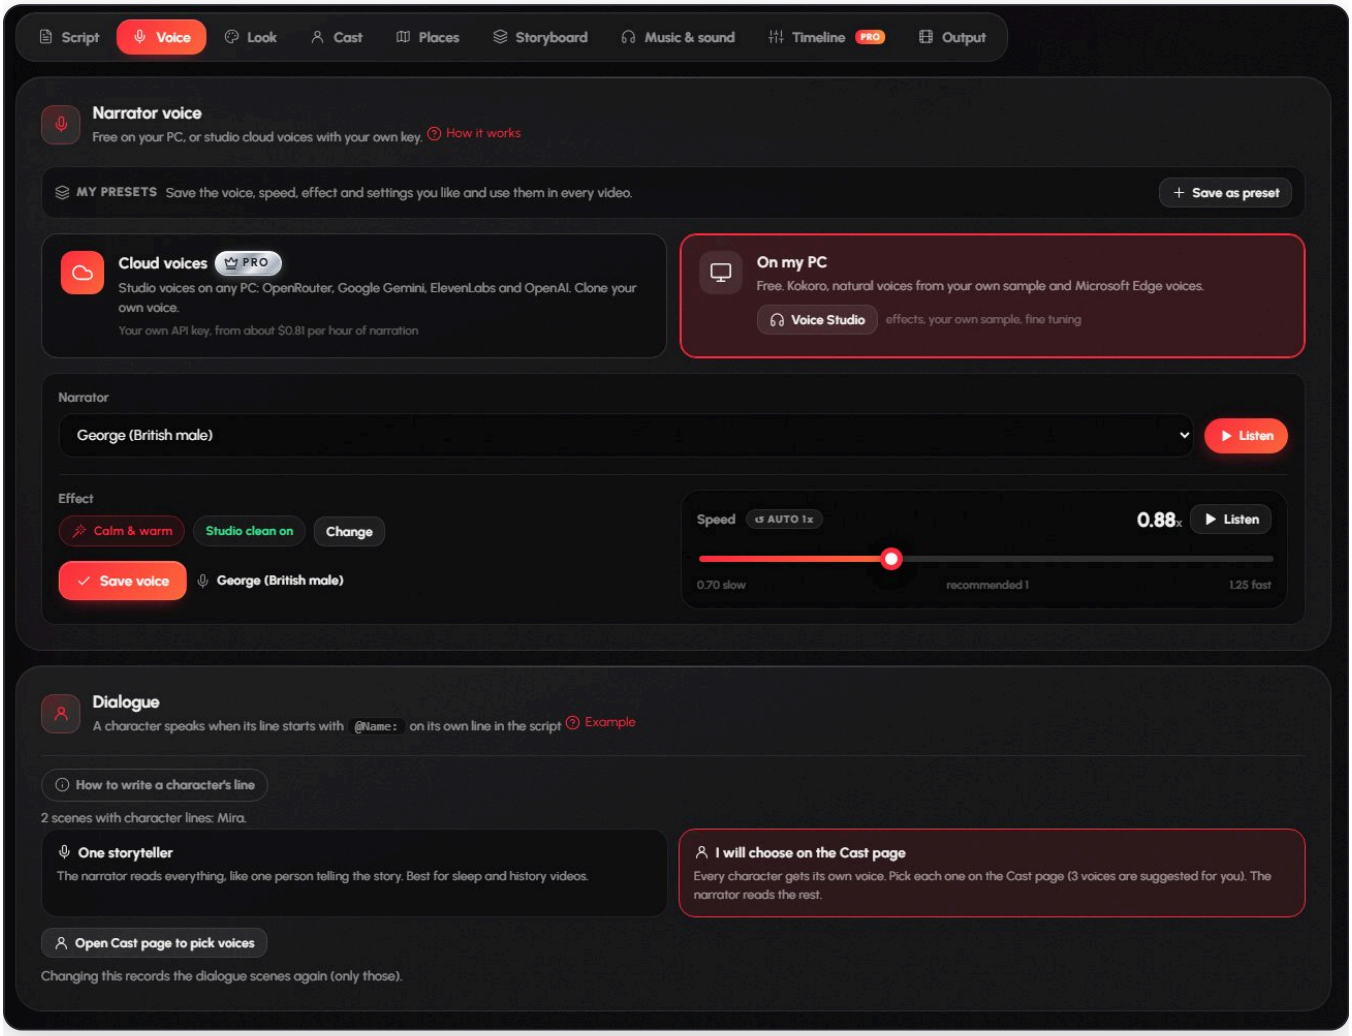

Pick **Rhyme (kids song)** on the Create page.

1. Under **Lyrics**, write your lyrics, click **Use the example**, or type a topic under **No lyrics yet? Write them with AI** and click **Write the rhyme** (needs Smart Director).
2. Every 2 lines get one picture. An `[IMG: ...]` line before a verse sets its picture. A `[CAST: Bobo = a little red bus ...]` line keeps a character the same.
3. Under **Song**, pick a **Music style** and a **Singer**. The song is sung on your PC by the AI Music model from Setup Center.
4. Click **Review first** or **Make my rhyme video**.

In a rhyme project the **Voice** tab is called **Song**. Click **Sing it now** or **Sing it again** after changing the style or singer, and **Play the song** to listen.

07

Voice

The Voice tab: narrator voice, speed and effect, plus Dialogue so each character can speak with its own voice.

Open a project and click the **Voice** tab.

Narrator voice

Choose where the voice is made:

- **On my PC**: free. Kokoro, natural voices from your own sample, and Microsoft Edge voices.
- **Cloud voices** (PRO): studio voices on any PC with your own key. Google Gemini, ElevenLabs, OpenAI and OpenRouter voices, and cloning your own voice.

Pick a voice under **Narrator**, click **Listen**, set the **Speed** (0.70 slow to 1.25 fast; **AUTO** is the recommended speed for the video type) and click **Save voice**. Then run **1 · Voice** or **Build everything** to record it.

The free voice engines

Engine	What it is	Notes
Kokoro British and American	Fast offline voices	Installed with the AI engine. A bit robotic but very fast.
Kokoro Spanish, Hindi, Portuguese (Brazil), French, Italian	Offline voices in more languages	The first use downloads a small language file.
Natural (Chatterbox Turbo, recommended)	Human-like narration	Install **Natural human voices (Chatterbox)** in Setup Center. The first natural voice takes 1 to 3 minutes to load.
Natural (Chatterbox, slower)	More control	Same install as above.
Microsoft Edge voices	Free online voices, works on any PC	Needs internet. Includes English (US, UK, Australia, India), Urdu, Hindi, Arabic, Spanish (Spain, Mexico, Colombia), Portuguese (Brazil), French, German and child voices.

If an Edge voice stops answering, OMNITUBE switches to an offline Kokoro voice of the same language and gender for 15 minutes and notes it in the build log. To use that voice for the whole video, pick the Kokoro voice yourself.

Voice Studio

Click **Voice Studio** (on the **On my PC** card) to fine-tune the free voices.

- **Templates**: one click sets voice, speed and effect and plays it. Examples: Sleep narrator, ASMR whisper, Bedtime storyteller, Documentary pro, Movie trailer, Horror narrator, YouTuber / podcast, Kids story, Old radio, Meditation guide.
- **Narrator**: click any voice and press play.
- **Upload my own voice (10 to 30 s)**: adds your sample as a natural voice. Only use a voice you have the rights to.
- **Effect**: hall echo, whisper, old radio and more. Click to hear it. **AUTO** is the effect for the video type.
- **Studio clean**: removes noise and hiss, softens "s" sounds and keeps the same loudness everywhere.
- **Test text**: type a line and press play.
- **Set as default** makes it the voice for new videos. **Use this voice** puts it on this project.

> Tip: Effect-only changes are fast. The voice does not need to be generated again.

Cloud voices (Pro)

Click **Cloud voices**, then a provider tab. Each tab shows the approximate cost per hour of narration.

- **Google Gemini**: 30 voices, 70+ languages, and you describe how it should sound. The first play takes about 15 to 20 seconds.

- **ElevenLabs**: the most natural voices and the best cloning. Choose a model (**Best**, **Steady** or **Budget**), and set **Stability**, **Similarity**, **Style exaggeration** (0 is best for narration) and **Speaker boost**. Browse **My voices** or the **Voice Library** (20,000+ voices) and click **Add**. A meter shows the characters left this month.
- **OpenAI**: clear natural voices; you describe tone, pace and emotion.
- **OpenRouter voices**: one OpenRouter account, three voice families: Kokoro in the cloud (about 3 cents an hour, approximate and set by the provider), Fish Audio Drama 3 (80+ languages) and Gemini. Nothing to install, so it works on any PC and Mac.

For Gemini and OpenAI, pick a **Delivery** (Storyteller, Sleep / bedtime, Documentary, Horror, Whisper / ASMR, Energetic, News) or describe it yourself. The delivery is never read aloud. Use **Test with these settings** before you save.

Clone your voice (ElevenLabs): upload 1 to 2 minutes of clear speech with no music. It appears in the list as your voice. Only clone a voice you own or have permission to use.

My presets

Save as preset stores the voice, speed, effect and settings you like. The preset bar shows on every project.

Dialogue voices per character

The **Dialogue** card on the Voice tab decides who speaks character lines:

- **One storyteller**: the narrator reads everything. Best for sleep and history videos.
- **I will choose on the Cast page**: every character gets its own voice. Three voices are suggested for each character on the Cast page. The narrator reads the rest.

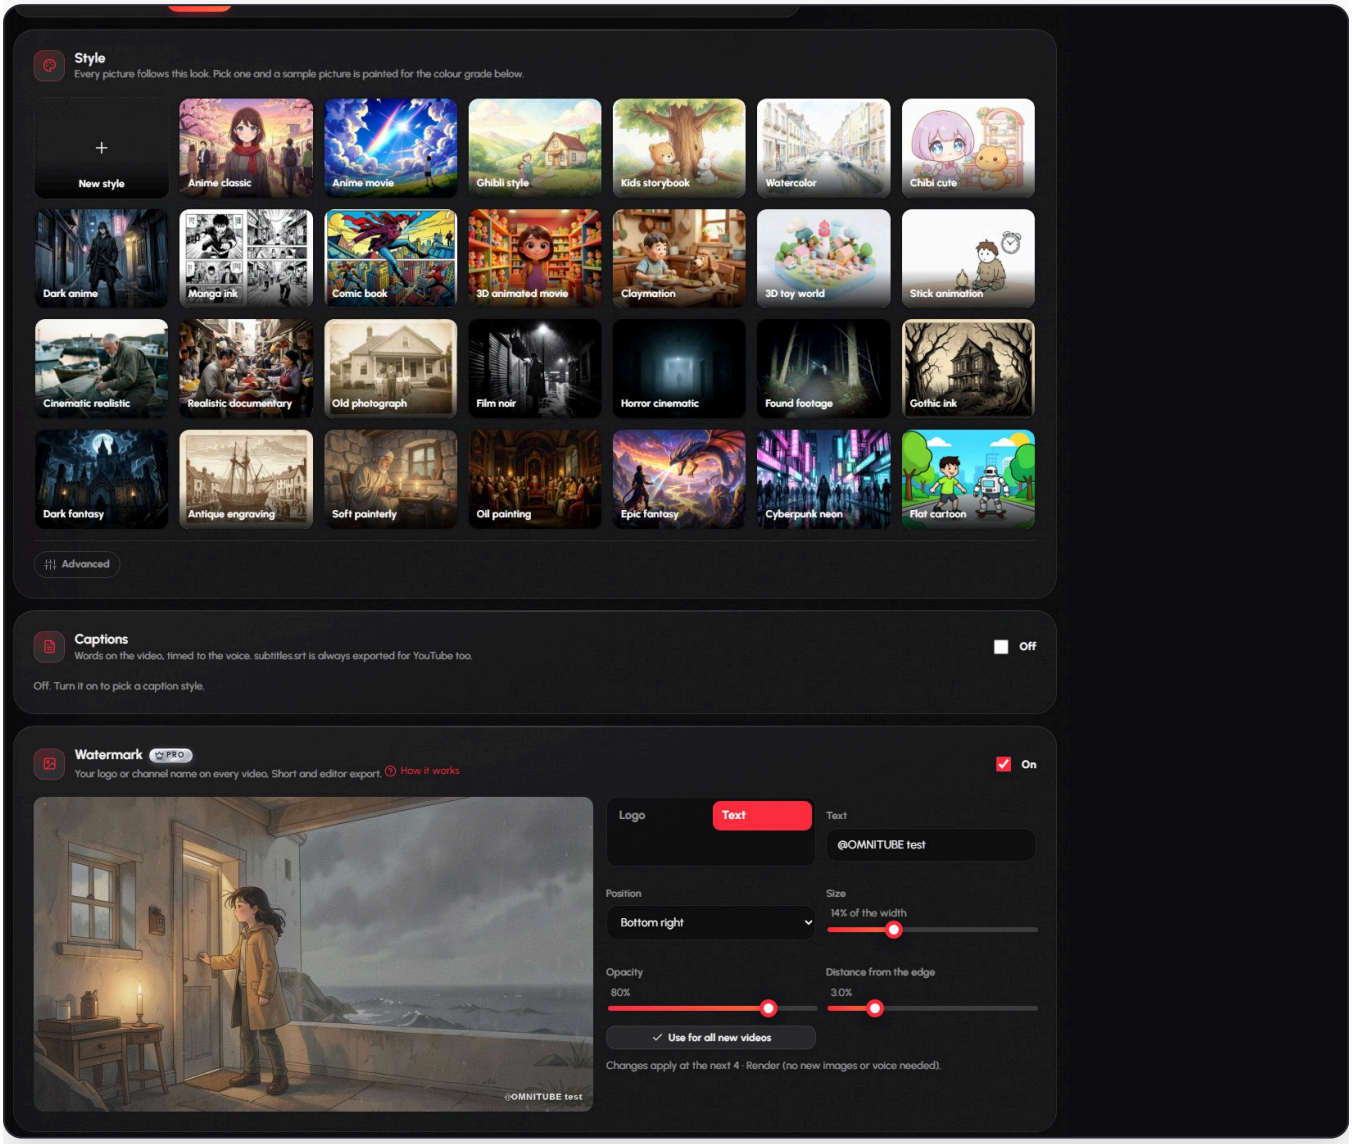

Changing this records only the dialogue scenes again. Open **How to write a character's line** on the card for the exact format.

Common mistakes

- Not clicking **Save voice**. The panel shows **not saved yet** until you do.
- Expecting a cloud voice to record on **1 · Voice** without Pro. Free projects use the On my PC voices.

08

Look

The Look tab: 34 picture styles, captions and the new Pro watermark with a live preview.

The **Look** tab controls style, captions, watermark and colour.

Style

Every picture and every person in it follows the style. Click a style card and OMNITUBE paints a sample picture for the colour grade below. Styles come in groups: Anime, 3D, Cartoon, Realistic, Horror and Art (for example Ghibli style, 3D animated movie, Claymation, Stick animation, Cinematic realistic, Film noir, Gothic ink, Watercolor, Cyberpunk neon).

Under **Advanced**:

- **Style text**: the words added in front of every picture prompt.
- **Same seed for every picture**: more uniform colours, less variety.

- **Body check**: Smart Director checks pictures with people and paints them again when a body is broken. A few seconds per picture.

Click **Save** after changing these.

My styles

Make your own picture style. Click the **New style** card in the style gallery.

1. Give it a **Name**.
2. Click **Add pictures** and add 1 to 6 pictures with the look you want. The AI reads their art style and new pictures copy their look. This takes about 30 seconds, up to 2 minutes the first time.
3. Or describe the style in words (needed when you add no pictures).
4. Click **Make style**.

Under **Saved styles** you can **Use** a style, make it **Default for new videos**, **Edit** its words or delete it. Your style is used for every scene picture and every character and place sheet, on your PC or in the cloud.

> Tip: Reading a style from pictures needs Smart Director on your PC or a cloud script AI. Without one, write the style in words.

Captions

Turn captions **On** and pick a caption style. Then set **Font**, **Size**, **Words per caption**, **Position** (bottom, middle, top), **Text colour**, **Spoken word colour** and **UPPERCASE**. Captions are timed to the voice. A `subtitles.srt` file is always exported for YouTube too. Changes apply at the next **4 · Render**; no new images or voice are needed.

Watermark (Pro)

Your own logo or channel name on your videos is a Pro feature. Free videos never get any watermark. Turn the **Watermark** card **On**, then:

- Choose **Logo** (click **Upload logo**; a PNG with a transparent background looks best) or **Text** (for example `@YourChannel`).
- Set **Position** (Top left, Top right, Bottom left, Bottom right, Center), **Size** (percent of the video width), **Opacity** and **Distance from the edge**.
- Click **Use for all new videos** to make it your default.

The watermark goes on every video, Short and editor export. Changes apply at the next **4 · Render**.

Color grade

Pick a grade card. **Auto** picks a grade for the video type and style and tells you why. Then set **Grade strength**, **Film grain**, **Vignette** and **Cinema bars**. A before and after preview shows the effect.

Advanced: reference picture: click **Add video or picture** (a trailer or a picture). Use a frame as the **Style image** (new pictures copy its look) or **Match colours** (a grade made from that frame). You can

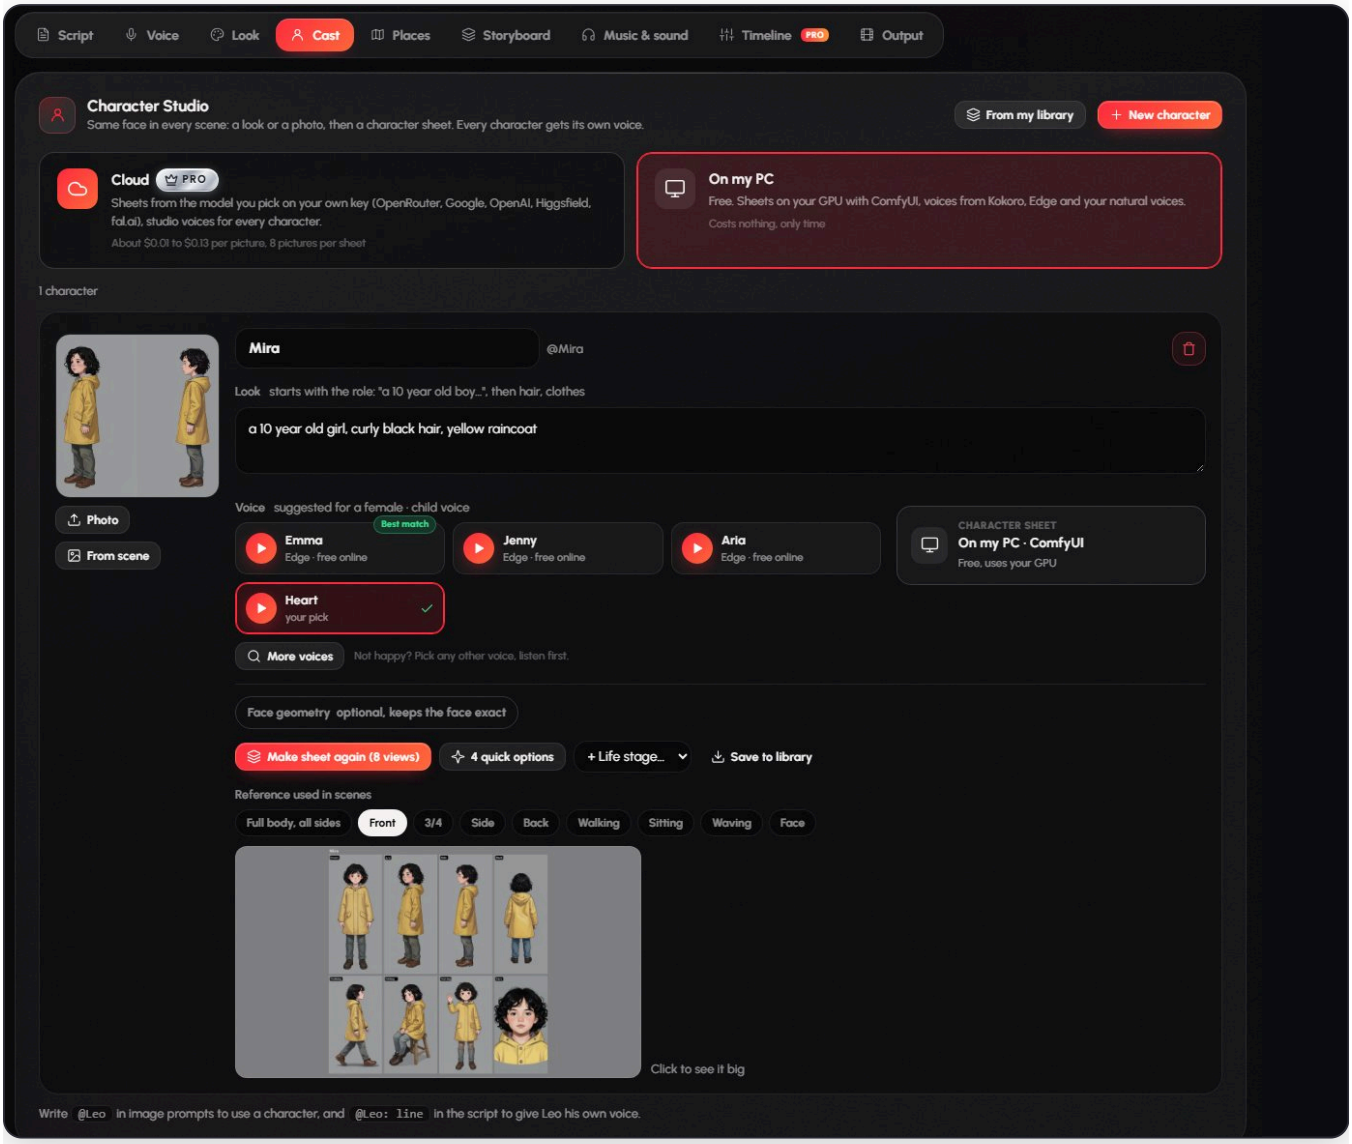

also pick a style image from your scenes or **Upload** one. Use this only for look and colour, never to copy a film's scenes.

Camera

The camera is set per scene on the Storyboard. **Auto Director** gives every scene a camera, angle, light and motion, and the **Shot** button opens the Shot Builder for one scene. See Storyboard.

09

Cast

Character Studio: one look per character, a character sheet and a voice for every character.

The **Cast** tab is the Character Studio. It keeps the same face in every scene.

Where sheets are made

- **On my PC**: free. Sheets on your GPU with ComfyUI. Voices from Kokoro, Edge and your natural voices.
- **Cloud** (PRO): sheets from the model you pick on your own key (OpenRouter, Google, OpenAI, Higgsfield) and studio voices for every character. About $0.01 to $0.13 per picture and 8 pictures per sheet (approximate, set by the provider).

Add characters

- Write `[CAST: Leo = a 10 year old boy ...]` in the script, or click **New character**.

- **From my library** adds a character you saved before.

The character card

- **Look**: start with the role ("a 10 year old boy..."), then hair and clothes. Without a look, a character can look different in every scene.
- **Photo**: upload a photo. The sheet copies this face. **From scene** uses a scene picture.
- **Voice**: the suggested voices, with **Best match** first. Press play to hear the character say a line. **More voices** lets you search all voices, or choose **Narrator voice**.
- **Face geometry** (optional): keeps the face exact. **Describe from photo (AI)** fills it for you.
- **Make character sheet (8 views)**: the reference used in every scene.
- **4 quick options**: four pictures to choose from.
- **+ Life stage...**: add the same character at another age.
- **Save to library**: use this character in any project.
- **Reference used in scenes**: choose which view goes into the scenes.

Make all sheets makes every missing sheet in one go. Cast changes save by themselves a moment after you stop typing.

> Tip: In prompts, write `@Leo` to use a character. In the script, write `@Leo: line` on its own line to give Leo his own voice.

10

Places

The **Places** tab makes scene sheets: like character sheets, but for rooms and streets. Every scene in the same place uses its sheet, so the room keeps the same walls, furniture and light.

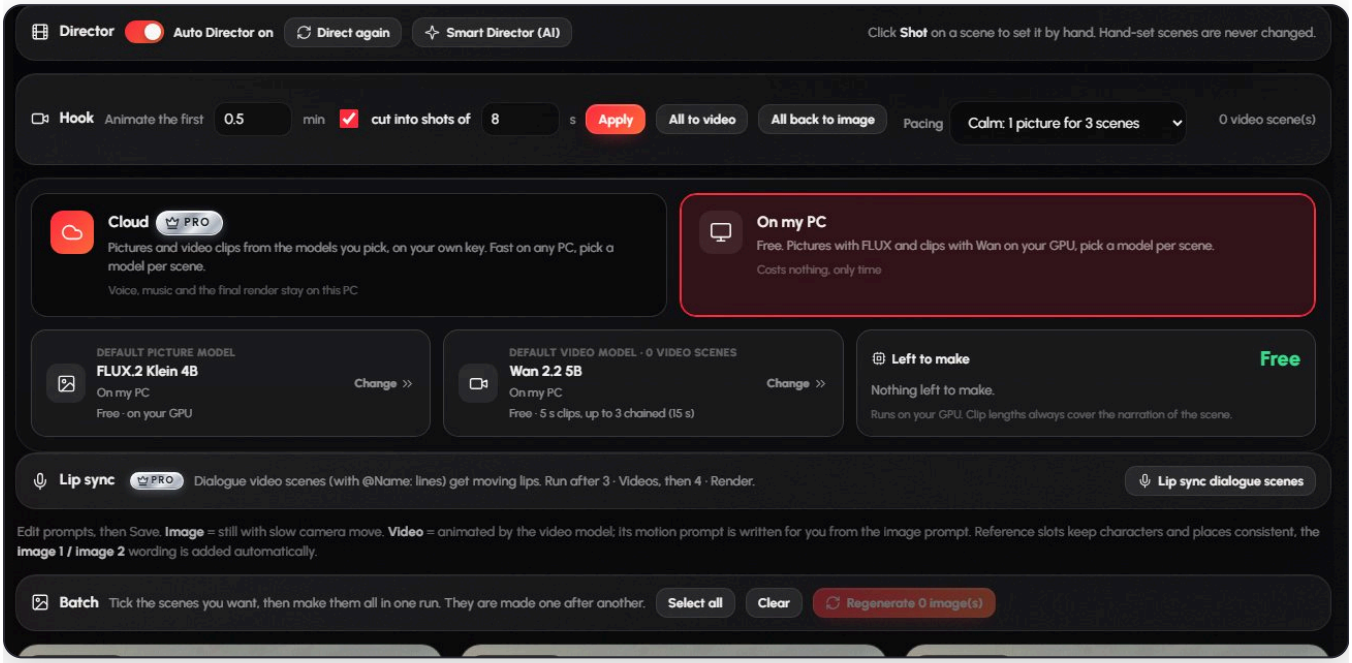

1. Click **Find places in my story**, or **New place**, or write `[PLACE: Name = look]` in the script.
2. Set **This place is Indoor** (inside views plus the outside of the building) or **Outdoor** (outdoor views only).
3. Write the **Look of the place**: walls, furniture, colours, light. The same words go into every scene there.
4. Click **Make scene sheet**, or upload your own **Picture**.

Choose **On my PC** (free, ComfyUI) or **Cloud** (PRO, 2 to 3 pictures per place, about $0.02 to $0.45 a sheet, approximate). The option **Build everything makes a sheet for every place used by 2 or more scenes** is on by default.

A scene without a place word stays where the scene before it was. Change any scene's place on the Storyboard. Write `@Name` in a prompt (the place name without spaces) to put a scene there.

11

Storyboard

Director, Hook and the new Pacing menu (here Calm: 1 picture for 3 scenes).

The **Storyboard** tab shows every scene with its picture, narration and prompt.

Director

- **Auto Director** on: every new picture gets a fitting camera, angle, light and motion.
- **Direct again**: sets the camera again for every scene. Scenes you set by hand are kept.
- **Smart Director (AI)**: the local AI reads your script and directs it (needs Smart Director in Setup Center).

On my PC or Cloud

The card at the top chooses where pictures and clips are made:

- **On my PC**: free. Pictures with FLUX and clips with Wan on your GPU.
- **Cloud** (PRO): pictures and clips from the models you pick, on your own key. Voice, music and the final render stay on your PC.

Next to it you see **Default picture model** and **Default video model** (click **Change** to pick another) and a cost box. On the cloud it shows **Cost of what is left** with the price per picture and per second; already made pictures and clips cost nothing again.

> Tip: In a cloud build, the **On my PC** button on a scene makes only that scene free on your GPU.

Images and video scenes

Each scene has **Image** or **Video**:

- **Image**: a still with a slow camera move.
- **Video**: animated by the video model. Its motion prompt is written for you from the image prompt. Click **Rewrite** to write it again.

Every video is animated from the scene image, so the image must exist first.

Hook

The **Hook** bar turns the opening into video: **Animate the first** [minutes], optionally **cut into shots of** [seconds], then **Apply**. **All to video** turns every scene into a video scene, and **All back to image** turns them back (made videos stay on disk).

> Tip: Video costs more and takes longer than stills. Animate only the hook (the first 1 to 3 minutes) and keep the rest as images.

Pacing

Pacing on the Storyboard sets how often a new picture is made:

Pacing	What happens	Pictures
Fast	Every scene gets its own picture	All scenes
Normal	The next scene shows a close-up of the same picture	About half
Calm	The next two scenes show a close-up and then a pan of the same picture	About one third

The camera still moves on every cut, so the video does not look static. A picture is only reused inside one chapter. A scene with its own `[IMG: ...]` line, a video scene, a scene set in the Shot Builder or a scene that already has its own picture always keeps its own picture. The cost estimate updates as soon as you change the pacing.

> Tip: Calm suits sleep, history and documentary videos and cuts cloud picture costs to about one third. To give one reused scene its own picture, select it and regenerate it.

Editing a scene

- Click the narration to edit it. Changing narration records that scene's voice again.
- Edit the **Image prompt**, then click **Save changes** (or **Discard**).
- Reference slots (**Reference: character or place**, **2nd reference**) keep characters and places the same. The "image 1 / image 2" wording is added automatically. **Auto** lets OMNITUBE pick again.
- The place menu sets where the scene happens.
- The model button picks a picture or video model for this scene only.

- The **Image** button with the refresh icon makes a new image (and a new video for a video scene). The **Video** button with the refresh icon makes the video again from the image.
- The **Image** button with the upload icon uses your own picture. **Clip** (with the plus icon) uses your own video clip.
- The arrows move a scene earlier or later. The star sets the thumbnail picture. The bin deletes the scene.

Regenerate many

Tick **Batch** on the scenes you want, then **Regenerate N image(s)**. They are made one after another in a single run. **Select all** and **Clear** help. Cloud models charge for each picture.

Shot Builder

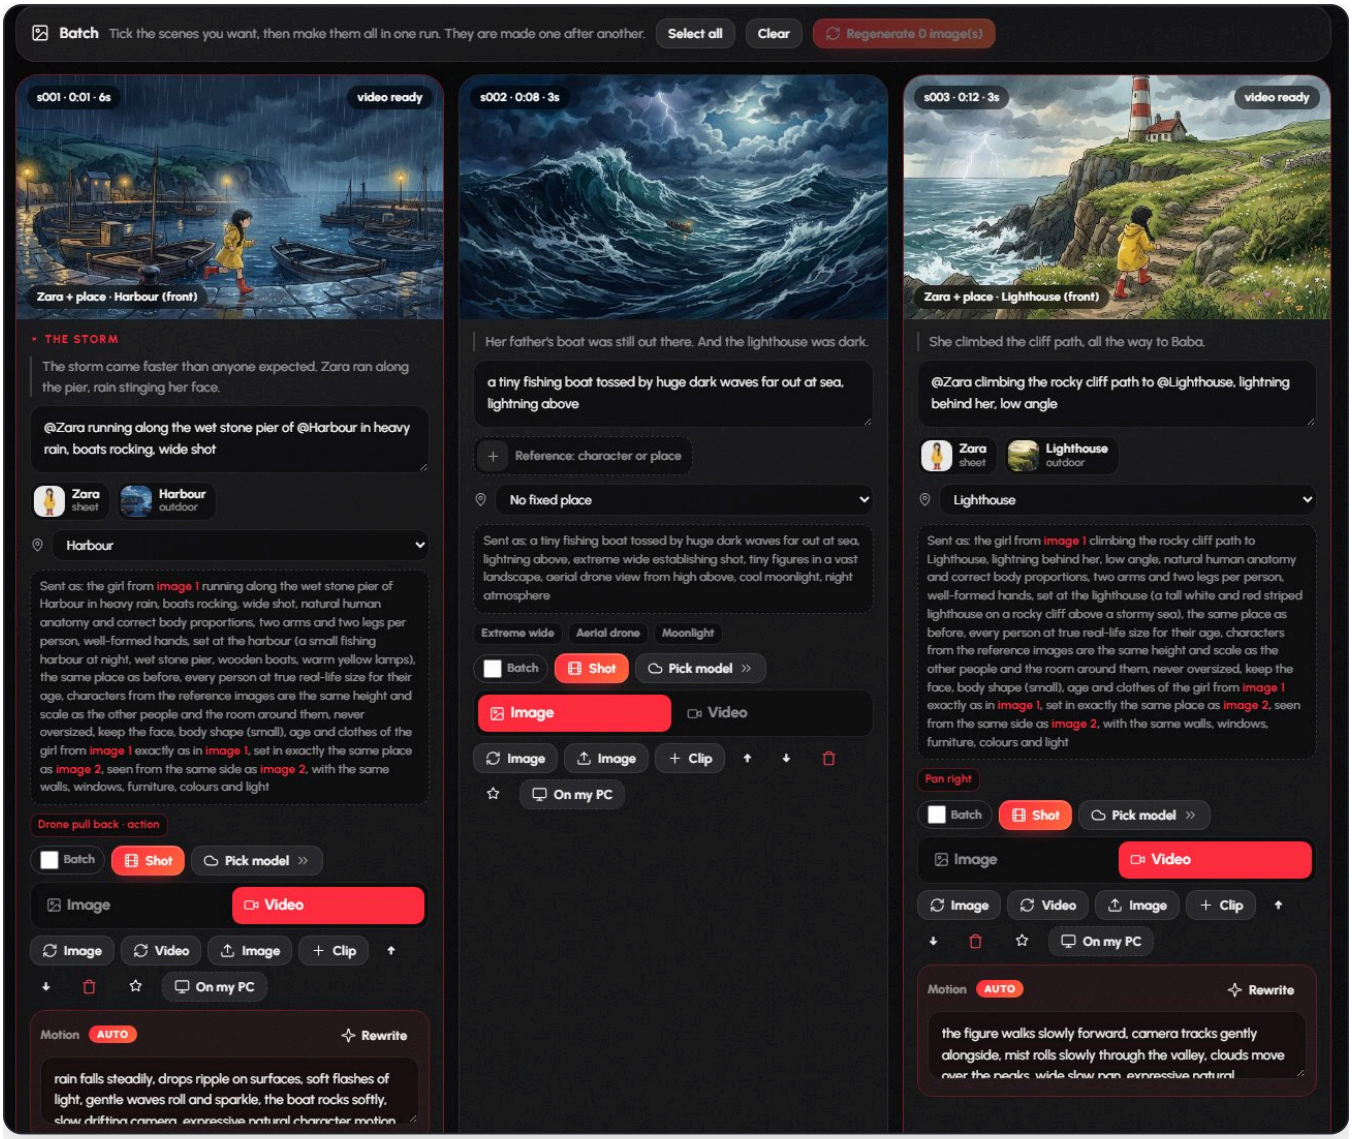

Click **Shot** on a scene:

- **Save & new image**, **4 options** (four versions to choose from), **From my PC**, **My image + animate**, **Character sheet from this image**.
- **Prompt sent to the image model**, and the **PICTURE formula** (Photographic style, Imagery, Camera composition, Timing & lighting, Use of film & effects, Render style, Extra details). Click **Write into prompt**.
- **Shot presets** and rows for **Shot**, **Angle**, **Lens**, **Camera** and **Light**. **Paint example pictures** shows a small picture for every option (needs ComfyUI, about 4 minutes).
- **Motion**: **Still image** or **Video (animate)**. For video: **Camera move (46)**, **Speed**, **Motion level (picks the video model)**, **What moves in the scene** and **Start the clip at** (trims a bad start).
- **Timing**: **Hold after the narration (s)**.
- **Save** or **Save & regenerate**.

Scenes you set by hand are never changed by the Director.

Lip sync (Pro)

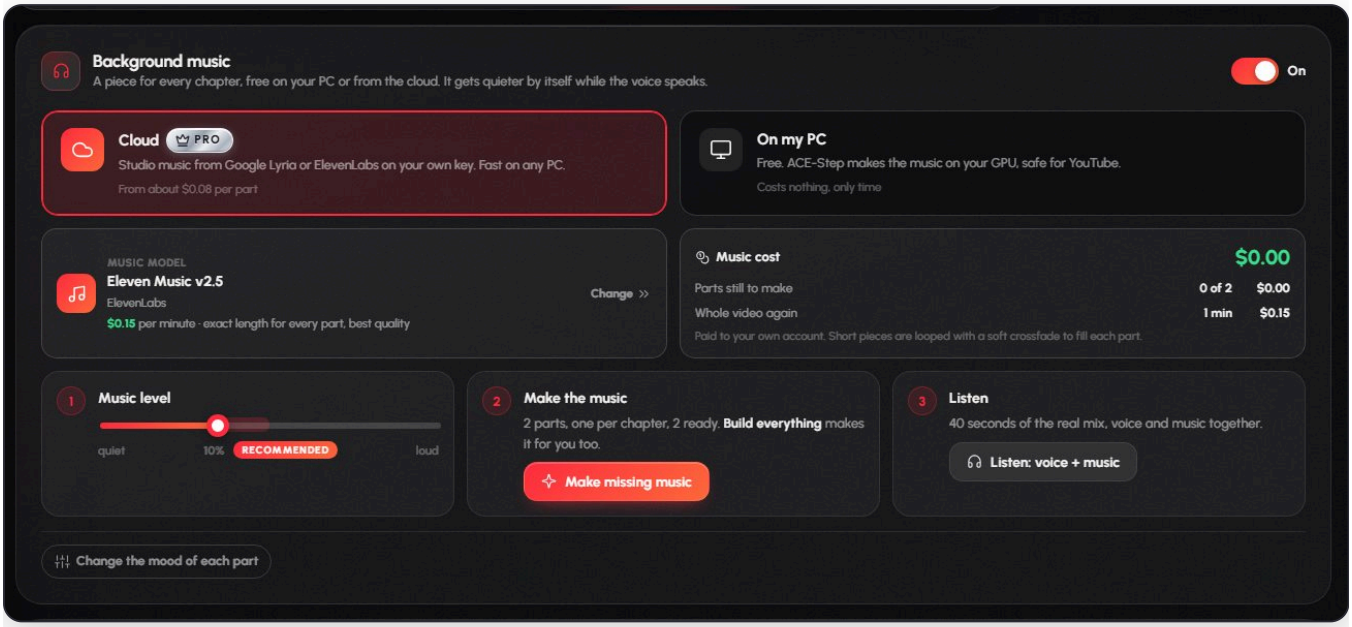

Dialogue video scenes (with `@Name:` lines) can get moving lips. Run **3 · Videos** first, then **Lip sync dialogue scenes**, then **4 · Render**. Lip sync runs on your fal.ai account. Before it starts, OMNITUBE shows how many scenes and seconds it will sync and the price (fal.ai charges about $3 per minute of video, set by fal.ai). Scenes that are already synced are skipped.

Storyboard cards: the picture, narration, prompt and Image or Video for every scene.

12

Music and sound

Music and sound: background music on your PC or in the cloud, with the cost shown before you make it.

Background music

On the **Music & sound** tab, music is **On** by default. It makes a piece for every chapter and gets quieter by itself while the voice speaks.

- **On my PC**: free. ACE-Step makes the music on your GPU, safe for YouTube. Install **AI Music (ACE-Step 3.5B)** in Setup Center.
- **Cloud** (PRO): studio music from Google Lyria or ElevenLabs on your own key. From about $0.08 per part (approximate). Click the music model to change it; the cost box shows the parts still to make.

Then:

1. **Music level**: 10 to 15% is recommended.
2. **Make the music**: click **Make music for my video** (or **Make missing music**). **Build everything** makes it for you too.
3. **Listen**: **Listen: voice + music** plays 40 seconds of the real mix.

Under **Change the mood of each part** you can pick a mood per chapter, add extra words (for example "flute, rain, 70 bpm"), and click **Make** or **Again**. **Reset moods from the video type** starts over. **Needle drops** stop the music for a moment at chosen scenes, for impact.

> Tip: Want your own music? Put royalty-free .mp3 files in `assets/music` (one is picked per video), or a `music.mp3` inside a project folder. On the Pro Timeline you can also drop your own music on a part.

Sound effects

Turn **Sound effects On**. They are placed by themselves from the story.

- **On my PC**: free, real recorded sounds from the built-in library and your own folder.
- **Cloud** (PRO): ElevenLabs makes a new sound for every scene from that scene's words. About $0.12 per minute of sound (approximate). Every AI sound is made once and kept, so building again costs nothing. If a sound fails, the library sound is used.

Pick a **Sound mood** (Auto follows the video type; funny and meme sounds play only in **Fun & memes**), set the **Effects volume**, and listen to the **Library sounds**. **Add your own sound folder** copies your sounds into the OMNITUBE library and sorts them by kind. Only use sounds you are allowed to use on YouTube.

13

Timeline (Pro)

The **Timeline** tab is an editor like Premiere, with a live preview. No render is needed to see a change.

The parts

- **Live preview** and **Rendered video** (after a render).
- Transport: start, previous scene, play or pause, next scene, and **Render video**.
- Tracks: **T1 Captions**, **V1 Pictures & videos**, **A1 Voice**, **A2 Clip audio**, **A3 SFX**, **A4 Music**. The **M** button mutes a track in the preview.
- **Linked** / **Unlinked**: linked selects the picture and voice of a scene together.
- **Add from my PC**: pictures, clips, sounds or music. You can also drag files onto the tracks.
- Zoom, **Fit**, **Snap** and **Undo**.

What you can change

Click any block and the **Inspector** shows its settings:

- **Voice line**: edit the **Spoken line**, **Save line**, then **Record changed lines**, or **Hear this line**.
- **Picture**: **Picture or clip from my PC**, **New picture**, **Camera move**, **Pause after the line**, the scene's **Sound effects**, and **Music drops out when this line starts**.
- **Caption**: fix the caption text without changing the voice, and change style, font, colours, size, words per caption and position.
- **Sound effect**: where on the line, which sound, **Hear it**, **Remove**, **Automatic again**.
- **Music part**: **Level of this part**, **Music volume (whole video)**, **Use my own music**.
- **Clip sound**: volume, or **Remove the sound**.

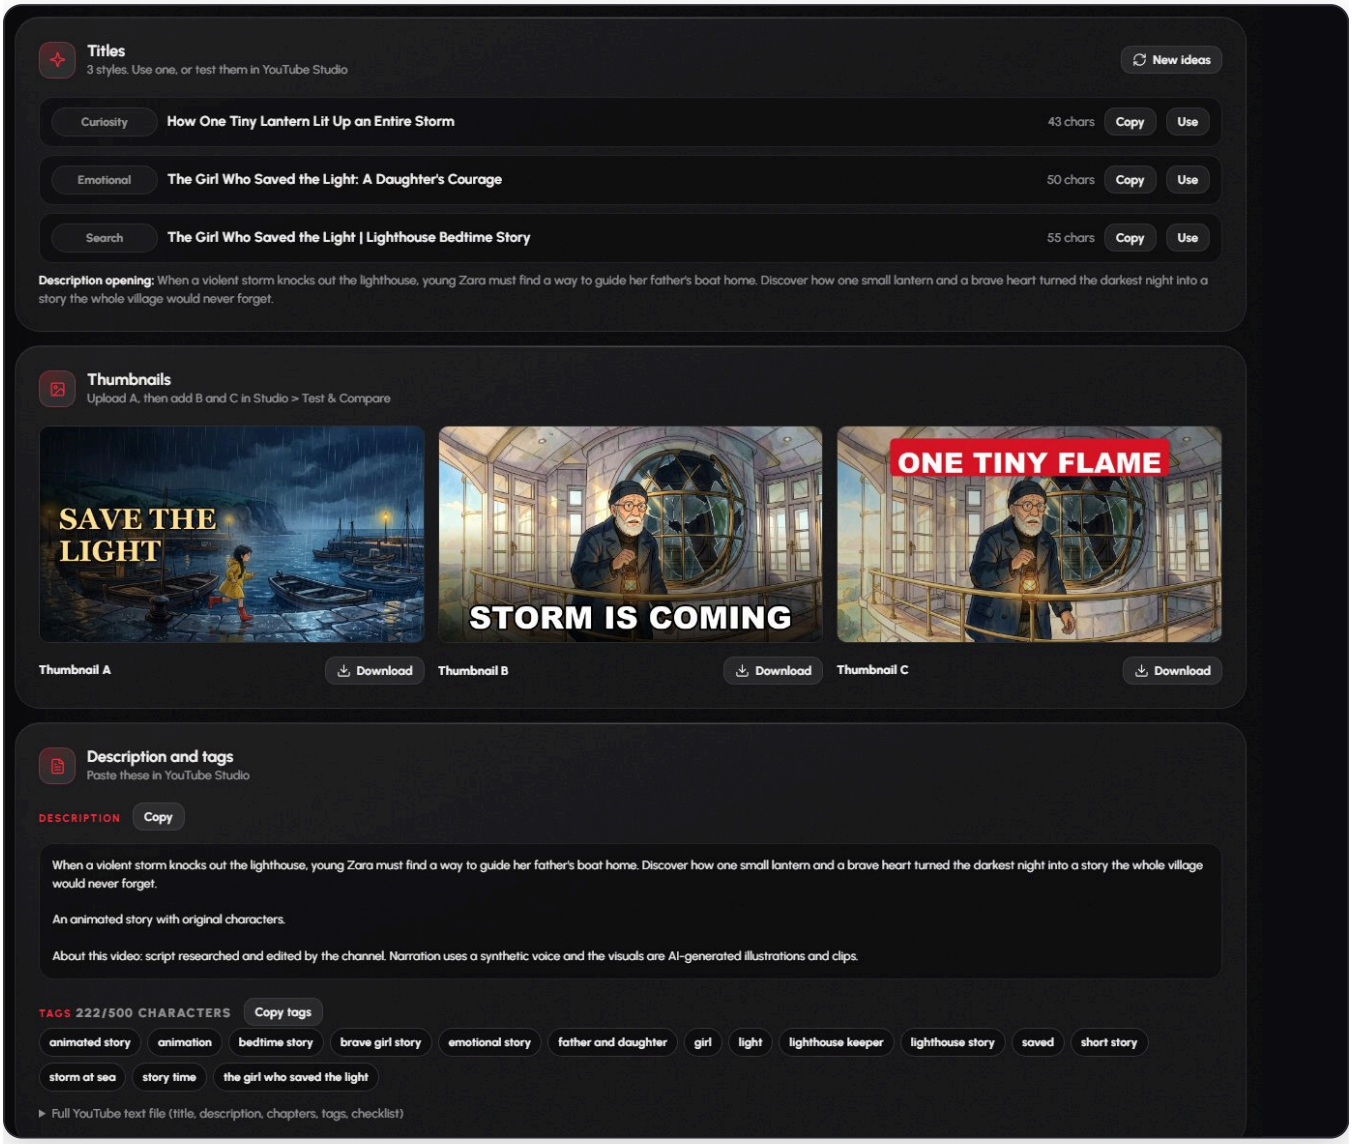

Dropping a picture or clip on a scene asks whether to **Add as a new clip after** it, **Add at the end**, or **Replace the picture**. Adding never replaces anything after it.

Shortcuts: Space play or pause, arrow keys previous or next scene, Del removes the selected sound, Ctrl+Z undo, Ctrl+wheel zoom.

> Tip: When everything looks right, click **Render video**. The timeline needs the narration first; if it is missing, OMNITUBE asks you to make the voice on your PC or in the cloud.

14

Output

The Output tab: 3 titles, 3 thumbnails, description and tags, ready for YouTube Studio.

The **Output** tab opens by itself when a build finishes.

Video and files

- **Video**: 16:9 for YouTube, or 9:16 for a Short.
- **Open output folder**, **Download video**, **Subtitles (.srt)**.
- **4K master** (PRO): a sharpened 3840×2160 master for YouTube.
- **Publish** (PRO): uploads or schedules the video on YouTube, TikTok, Instagram or Facebook through your Upload-Post account, with title, description, tags, privacy and the thumbnail (YouTube). Set it up once on the Pro page in the **Publish to YouTube, TikTok and Instagram** card: make an account at upload-post.com, create a profile, connect your channels to it, paste your

Upload-Post API key, click **Connect** and pick the profile. Long uploads keep going in Upload-Post; OMNITUBE waits and shows the result per platform in the log.

Titles, thumbnails and text

- **Titles**: 3 styles. **Copy** or **Use** one, or click **New ideas**. Install Smart Director for smarter AI titles.
- **Thumbnails**: Thumbnail A, B and C (and a Shorts cover 9:16). Upload A, then add B and C in YouTube Studio under Test & Compare. Set the thumbnail picture with the star on the Storyboard, then run **5 · Export**.
- **Description and tags**: **Copy** and **Copy tags** (the counter shows the 500 character limit). The full `youtube_metadata.txt` has the title, description, chapters, tags and checklist.

Shorts

Pick 3, 5, 7 or 10 and click **Make Shorts**. You get the best moments as vertical Shorts with captions, hook, music, a cover image, title and description. It needs the narration and takes about 1 minute per Short.

> Tip: Post one Short a day. In the YouTube app pick the cover as the thumbnail and set "Related video" to the main video.

Episode trailer

Season episodes get **Make trailer**: 30 seconds of the best moments with music, the season title and a "watch now" card, in 16:9 and 9:16. The ending is never shown.

Dub into other languages

Pick languages (Hindi, Arabic, Spanish, Portuguese, French, German and more) and click **Dub**. The narration is translated with your local AI and spoken in the same voice. You get an audio track, a video, subtitles and a title file for each language.

- Needs **Natural voices** and **Smart Director** from Setup Center.
- The first dub downloads the dubbing voice model once (about 3 GB). You can also get it in Setup Center under **Dubbing voices**.
- Urdu viewers understand the Hindi voice. Start with 3 to 5 big languages.

Upload checklist

The checklist keeps the channel safe for monetisation. Items with a warning sign still need your attention.

Export to Premiere Pro or CapCut

For documentary projects with a Pro look, the **Timeline** tab has **Premiere Pro** (XML with all pictures, motion graphics and audio stems) and **CapCut** (a best effort draft). See Documentary Studio.

Where files go

- Every project has its own folder. Use the folder button in the project header, or **Open output folder**.
- Choose an output folder in **Settings** or Setup Center (**Where finished videos go**). Every finished video, thumbnail and YouTube text is then copied to `<that folder>/<video title>/`.

15

Seasons

A season is a series of episodes with the same characters. Characters are made once and used in every episode.

1. Click **Seasons** in the sidebar, then **New season** (or pick **Season (series)** on the Create page).
2. Fill **Season name** and **Episode 1 title**.
3. Under **Characters of the season**, write one per line: `Name = what they look like` (age, hair, face, clothes).
4. Write the **Episode 1 script** and click **Create season & Episode 1**.
5. Build Episode 1. It makes every character sheet first.

For the next episode, open the season and click **New episode** (or **Next episode** in a project). The **@Name** chips put a character in the script. New characters can join in any episode and are shared with the whole season after that.

To change a character's picture, open any episode, go to the Cast tab and make a new sheet or upload a picture. It is used in episodes you build after that. **Remove season** removes the shared character list; the episodes stay as normal videos.

> Tip: Paste a whole OMNITUBE episode file (with boxes like `----- SCRIPT -----` and `----- END OF SCRIPT -----`, plus SEASON NAME, EPISODE TITLE and CHARACTERS boxes) into the script box. OMNITUBE fills the season name, title, characters and script, and reads `Video type:`, `Look:` and `Seconds per image:` lines too.

16

Documentary Studio (Pro)

Click **Documentary** in the sidebar. It makes a full documentary from a topic or from your own folder of photos and clips. Nothing is paid for before you approve the preview.

From a topic

1. Type the **Topic**, the **Language** and **Length (minutes)**.
2. Pick the **Research and writing AI**: **This PC with Ollama (free)** or **OpenRouter (live web search)**, and a model.
3. Pick a **Channel style** or leave **Choose for me**.
4. Click **Start research**. The Research card shows facts marked **Verified · 2+ websites**, **Wikipedia**, **One website** or **Disputed**, with sources.
5. Set the **Documentary style**, **Narration**, **Audience** and the **Pro look** (motion graphics, labels, article clippings, grade, sound effects and 3 second pacing).
6. Click **Find photos and clips**. OMNITUBE searches free archives such as Wikimedia Commons and NASA and saves each file with its licence (**Free to use**, **Credit needed**, **Not free**). Files that are not free are not downloaded.
7. Click **Write the story**. Edit any line, click a picture to swap it, or use **Improve the story** or **Write again**.
8. Check **Before you approve: cost**, then click **Approve and create the documentary**.

> Warning: Old photos can be public domain in Pakistan or India but still protected in the USA, and YouTube follows US law. Those are marked **Credit needed**. When in doubt, swap them for an AI picture.

From my folder

1. Pick the **Folder** with your photos, clips, audio and notes (**Browse**), and optionally **What is it about?**.
2. Click **Scan my folder**. Your files stay where they are.
3. **Let OMNITUBE look at every picture**: **On this PC** (free, nothing leaves your computer) or **In the cloud** (your OpenRouter account, faster). Click **Understand my pictures**.
4. Click **Write the story**. OMNITUBE may ask to improve the story first: **Yes, improve the story** or **No, keep my story**.
5. Approve to create the project.

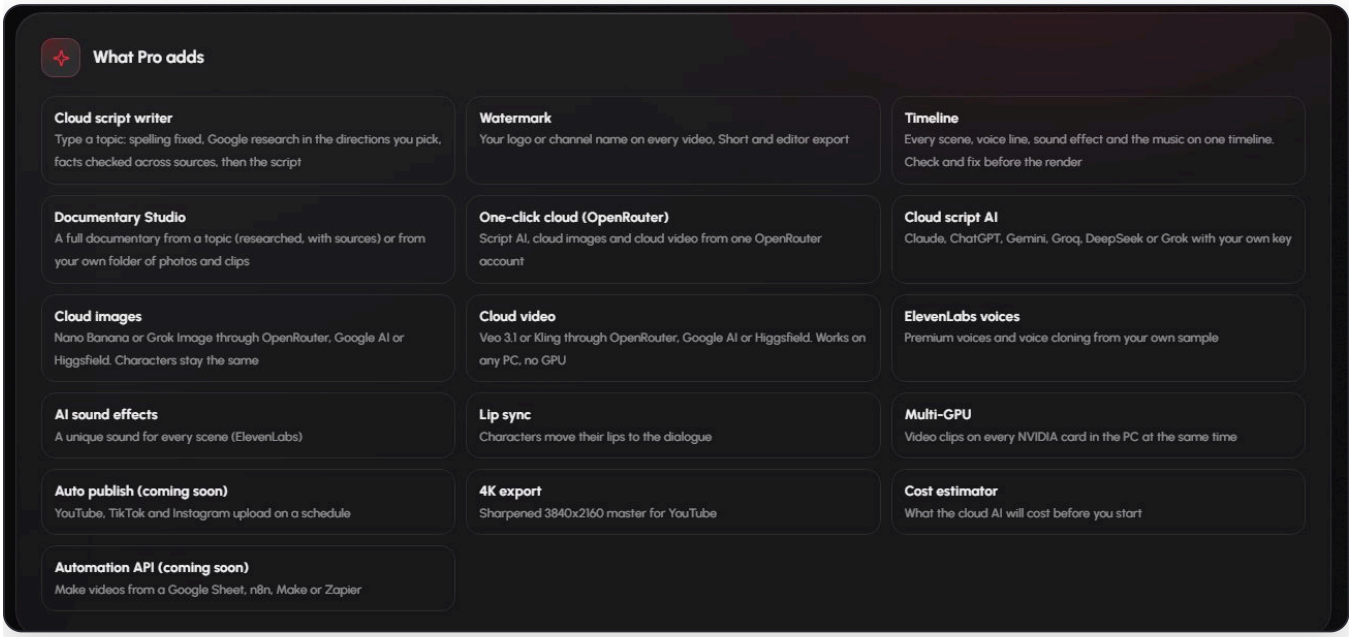

The buttons **Research**, **Images**, **Videos**, **Sources** and **Final Documentary** open those folders. Lines marked **Check** contain details that are not in your files or the checked research; edit them or keep them if you know they are right.

The documentary timeline

Open the project, check the Storyboard, then use the **Timeline** tab. It shows **Graphics**, **Shots**, voice and sound rows, with a frame preview. Change the look, click blocks to edit them, **Save**, **New plan**, then **Render video**. Export with **Premiere Pro** or **CapCut**. The rendered video is also copied to the Final Documentary folder.

17

OMNITUBE Pro

The Pro page lists everything Pro adds.

What Pro adds

The **Pro** page lists every Pro feature: Cloud script writer, Watermark, Timeline, Documentary Studio, One-click cloud (OpenRouter), Cloud script AI, Cloud images, Cloud video, ElevenLabs voices, AI sound effects, Lip sync, Multi-GPU, 4K export, the Cost estimator, Publish (through Upload-Post) and Use OMNITUBE from Claude. The Automation API is marked coming soon.

Activate Pro

1. Buy Pro at theharisai.gumroad.com/l/omnitube-pro.
2. Open **Pro** in the sidebar.
3. Paste the key from your Gumroad email into **License key** and click **Activate**.

The Pro page then shows **Pro active**. You activate once; reinstalling or resetting the same PC is fine, just activate the same key again.

Move Pro to another PC

Pro is bound to the PC you activate it on.

- On the old PC you can click **Move Pro to another PC**. This turns Pro off there and frees the key.
- On the new PC, paste the same key and click **Activate**. Pro moves by itself.
- The first move works at once. After that you can move once every 30 days. Reinstalling on the same PC never counts as a move.

Working offline

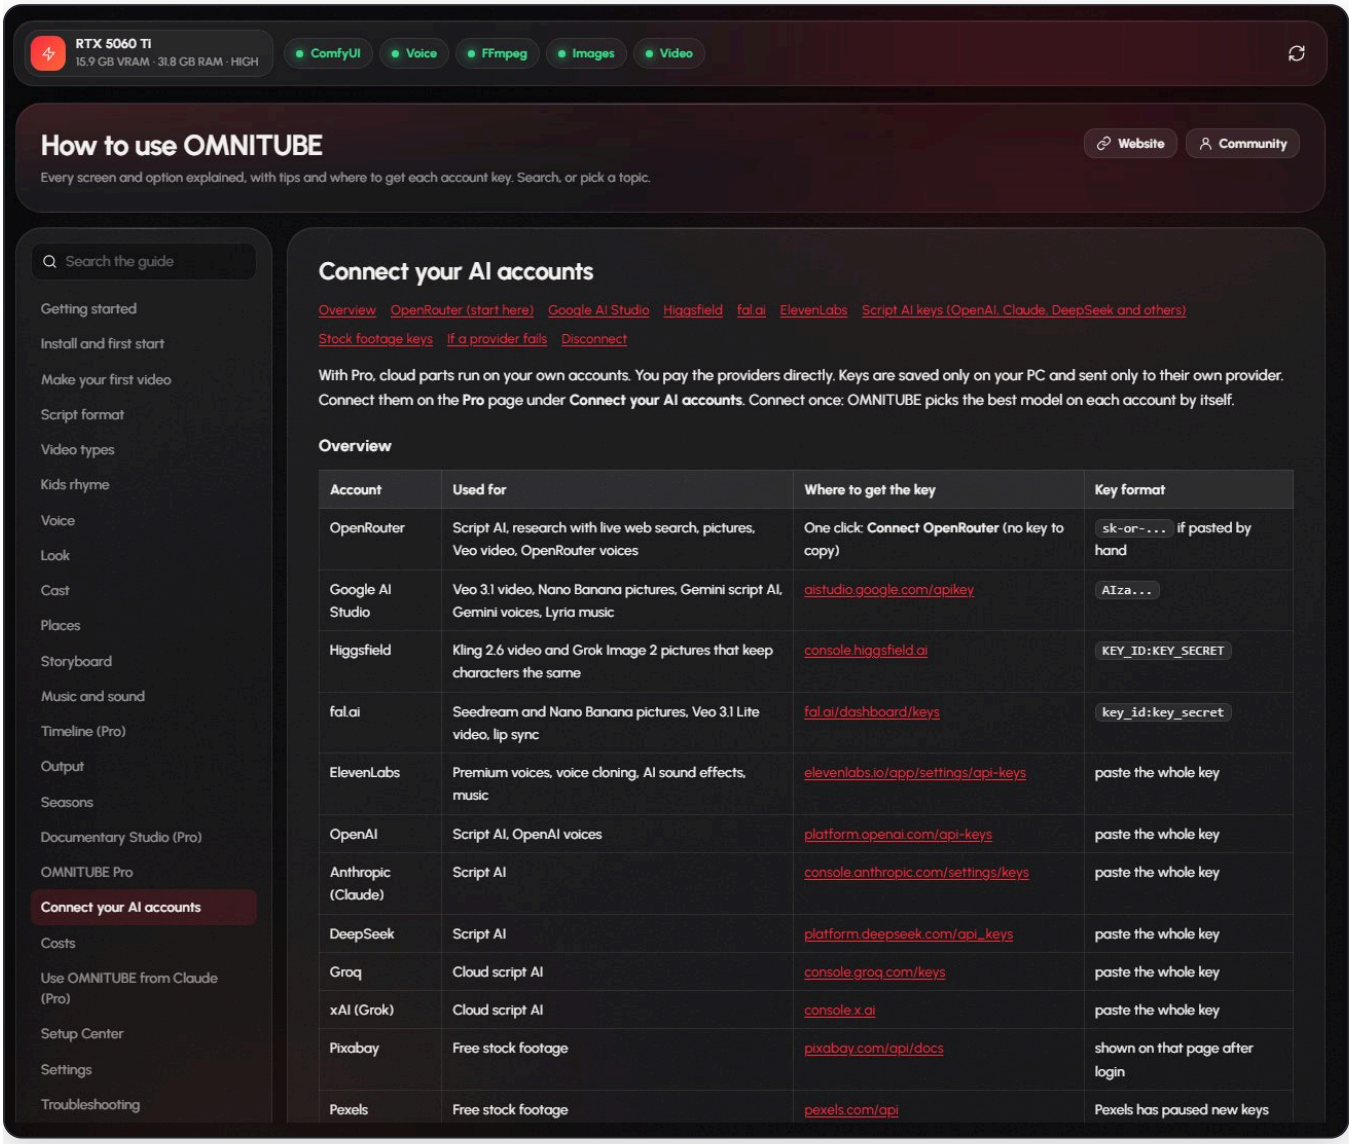

Pro keeps working without internet for up to 14 days after its last check. A short internet problem never locks you out.

Common mistakes

- Using an old version. If the Pro page says the version is too old, click **Update now**.
- Pasting a key with missing characters. Copy the whole key from the Gumroad email.

18

Connect your AI accounts

How to use > Connect your AI accounts: where to get every key, right inside the app.

With Pro, cloud parts run on your own accounts. You pay the providers directly. Keys are saved only on your PC and sent only to their own provider. Connect them on the **Pro** page under **Connect your AI accounts**. Connect once: OMNITUBE picks the best model on each account by itself.

Overview

Account	Used for	Where to get the key	Key format
OpenRouter	Script AI, research with live web search, pictures, Veo video, OpenRouter voices	One click: **Connect OpenRouter** (no key to copy)	`sk-or-...` if pasted by hand

Account	Used for	Where to get the key	Key format
Google AI Studio	Veo 3.1 video, Nano Banana pictures, Gemini script AI, Gemini voices, Lyria music	aistudio.google.com/apikey	`AIza...`
Higgsfield	Kling 2.6 video and Grok Image 2 pictures that keep characters the same	console.higgsfield.ai	`KEY_ID:KEY_SECRET`
fal.ai	Seedream and Nano Banana pictures, Veo 3.1 Lite video, lip sync	fal.ai/dashboard/keys	`key_id:key_secret`
ElevenLabs	Premium voices, voice cloning, AI sound effects, music	elevenlabs.io/app/settings/api-keys	paste the whole key
OpenAI	Script AI, OpenAI voices	platform.openai.com/api-keys	paste the whole key
Anthropic (Claude)	Script AI	console.anthropic.com/settings/keys	paste the whole key
DeepSeek	Script AI	platform.deepseek.com/api_keys	paste the whole key
Groq	Cloud script AI	console.groq.com/keys	paste the whole key
xAI (Grok)	Cloud script AI	console.x.ai	paste the whole key
Pixabay	Free stock footage	pixabay.com/api/docs	shown on that page after login
Pexels	Free stock footage	pexels.com/api	Pexels has paused new keys
Upload-Post	Publish to YouTube, TikTok, Instagram, Facebook	upload-post.com, dashboard, API Keys	paste the key, then pick your profile

OpenRouter (start here)

1. On the Pro page, in the **OpenRouter** tile, click **Connect OpenRouter**.
2. Your browser opens. Log in and click **Authorize**. Come back to OMNITUBE.
3. The tile shows your key, your **Balance** and what you used.
4. Click **Add credit** to top up at openrouter.ai/credits.

Prefer to paste a key? Open **Or paste a key by hand**, paste the `sk-or-...` key and click **Save key**.

> Tip: One OpenRouter account covers scripts, research, pictures, video and voices. OpenRouter charges a small fee when you buy credits (about 5.5%, set by OpenRouter).

Google AI Studio

1. Open aistudio.google.com/apikey and sign in with your Google account.
2. Create an API key and copy it. It starts with `AIza`.
3. Paste it in the **Google AI** tile and click **Connect**.

The same key runs Gemini voices, Google research, cloud pictures, Veo video and Lyria music. It is paid straight to Google with no OpenRouter fee.

> Warning: A Google Flow subscription is separate and cannot be used by any app. You need an API key from AI Studio.

Higgsfield

1. Open console.higgsfield.ai and create an API key.
2. Copy both parts and paste them as `KEY_ID:KEY_SECRET` (with the colon) in the **Higgsfield** tile.
3. Click **Connect**.

fal.ai

1. Open fal.ai/dashboard/keys and create a key.
2. Paste it in the **fal.ai** tile and click **Connect**.

fal.ai is pay per use and works on any PC, also AMD and laptops without a GPU. Lip sync uses fal.ai.

ElevenLabs

1. Open elevenlabs.io/app/settings/api-keys and create an API key.
2. Paste it in the **ElevenLabs** tile and click **Connect**.
3. Your voices appear in every voice picker. Use **Reload voices** after adding voices in ElevenLabs, and **Clone my voice** to upload a sample.

Script AI keys (OpenAI, Claude, DeepSeek and others)

The cloud script writer on the Create page has its own **Script AI** picker. Pick the provider tab, paste the key, click **Connect**. OMNITUBE checks the key, finds the models and selects the best one. Each tab has a link to get the key: OpenAI at platform.openai.com/api-keys, Claude at console.anthropic.com/settings/keys, DeepSeek at platform.deepseek.com/api_keys. The Pro feature list also names Groq and Grok (xAI) as cloud script AI. When OMNITUBE asks for one of those keys, get it at console.groq.com/keys or console.x.ai.

Stock footage keys

Stock footage gives real video clips for documentary and faceless videos, free, without a GPU. Open **Settings**, go to **Stock footage**, and paste a Pixabay key (recommended; the key is shown on pixabay.com/api/docs after you log in) or a Pexels key.

If a provider fails

When a cloud picture or clip fails (no credit, key rejected, busy or down), OMNITUBE makes the same picture or clip on the next connected account and notes it in the build log. Connecting two accounts makes long builds safer.

Disconnect

Click **Disconnect** on a tile to remove that key from OMNITUBE.

19

Costs

Free builds cost nothing. Cloud parts are billed by your providers at their own prices. OMNITUBE shows approximate list prices and adds nothing.

The estimate before a build

When you start **Build everything**, **Preview first**, **1 · Voice**, **2 · Images** or **3 · Videos** with cloud parts, OMNITUBE shows a **Cost estimate** first:

- The total as a range, for example "$1.20 to $1.50". The high end covers retries and failed generations that some providers still bill.
- One line per part: pictures, video clips, voice, music, sound effects, character and place sheets, and script AI calls.
- **Already spent on this project** and, after a build, the estimate and the actual cost of the last build.

Click **Continue** to build, or **Change providers** to go to the Pro page.

The 20% stop

Tick **Pause the build if it costs more than 20% over this estimate**. If the money actually spent goes 20% over the estimate, the build pauses so you can check before spending more. The setting stays on for every build until you untick it.

Money spent

OMNITUBE tracks the money actually spent per video. Every cloud call counts, also a failed one. You see it in the cost estimate under **Already spent on this project**.

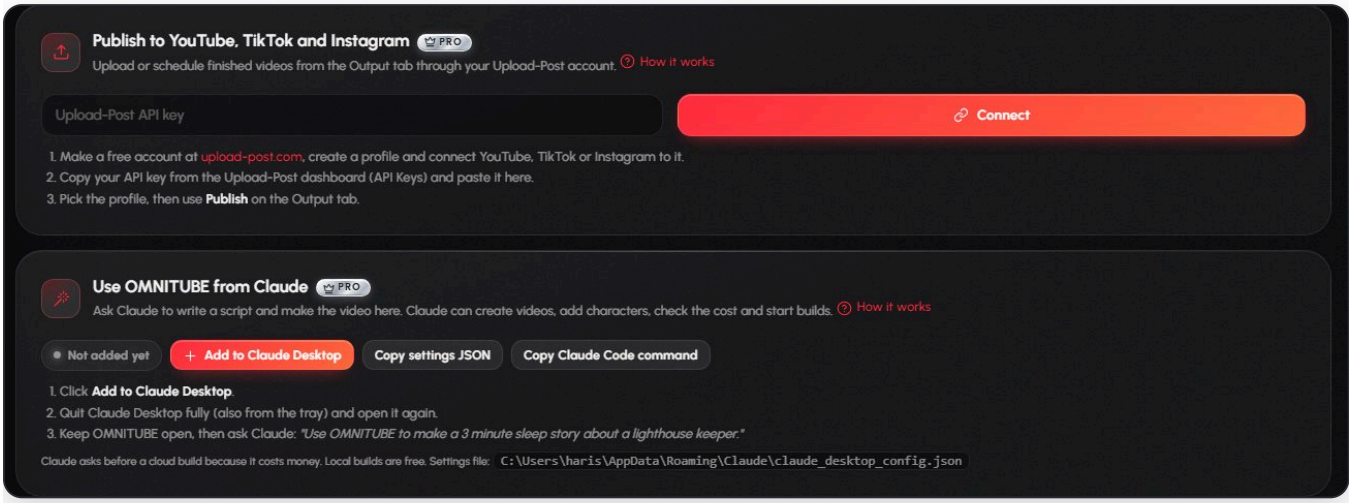

How to keep costs low

- Start with a short test video (1 to 2 minutes) and check the estimate before a long one.
- Set **Pacing** on the Storyboard to **Normal** or **Calm**: fewer new pictures, about half or one third of the picture cost. See Pacing.
- Use **Preview first** before the full build.
- Use the free voices (Kokoro, Edge or natural voices) or OpenRouter's Kokoro voice in the cloud.
- Make pictures **On my PC** if you have an NVIDIA card, and use the cloud only for video.
- Animate only the hook. Keep the rest as images.
- In a cloud build, click **On my PC** on scenes that do not need a cloud model.
- Already made pictures, clips, music and AI sounds are never paid for again. Only regenerating costs money.
- Use **Make missing music** instead of making every part again.

Tip: Setup Center notes that a Pro cloud video usually costs about $0.50 to $2 (approximate, set by your providers and your choices).

20

Use OMNITUBE from Claude (Pro)

Pro page: Publish via Upload-Post and Use OMNITUBE from Claude, set up in one click.

Ask Claude to write a script and make the video in OMNITUBE. Claude can create videos, add characters, check the cost and start builds.

Set it up

1. Install Claude Desktop from claude.ai/download if you do not have it.
2. In OMNITUBE open **Pro** and find the card **Use OMNITUBE from Claude**.
3. Click **Add to Claude Desktop**. The card then shows **Added to Claude Desktop**.
4. Quit Claude Desktop fully (also from the tray) and open it again.
5. Keep OMNITUBE open, then ask Claude.

Using Claude Code instead? Click **Copy Claude Code command** and paste it in your terminal. **Copy settings JSON** gives the settings for other setups. **Remove** takes OMNITUBE out of Claude Desktop again.

Example requests

- "Use OMNITUBE to make a 3 minute sleep story about a lighthouse keeper."
- "Write a 5 minute horror story with two characters and their own voices, then show me the cost."
- "Add a character called Mira, a 10 year old girl with curly black hair, to my last video."
- "Change the narrator voice, turn captions on and set the watermark to @MyChannel."
- "Build it on my PC for free."
- "What is OMNITUBE building now?"
- "Open the folder with the finished video."

What Claude can do

- Check if OMNITUBE is open, if Pro is active, which accounts are connected and what is building.

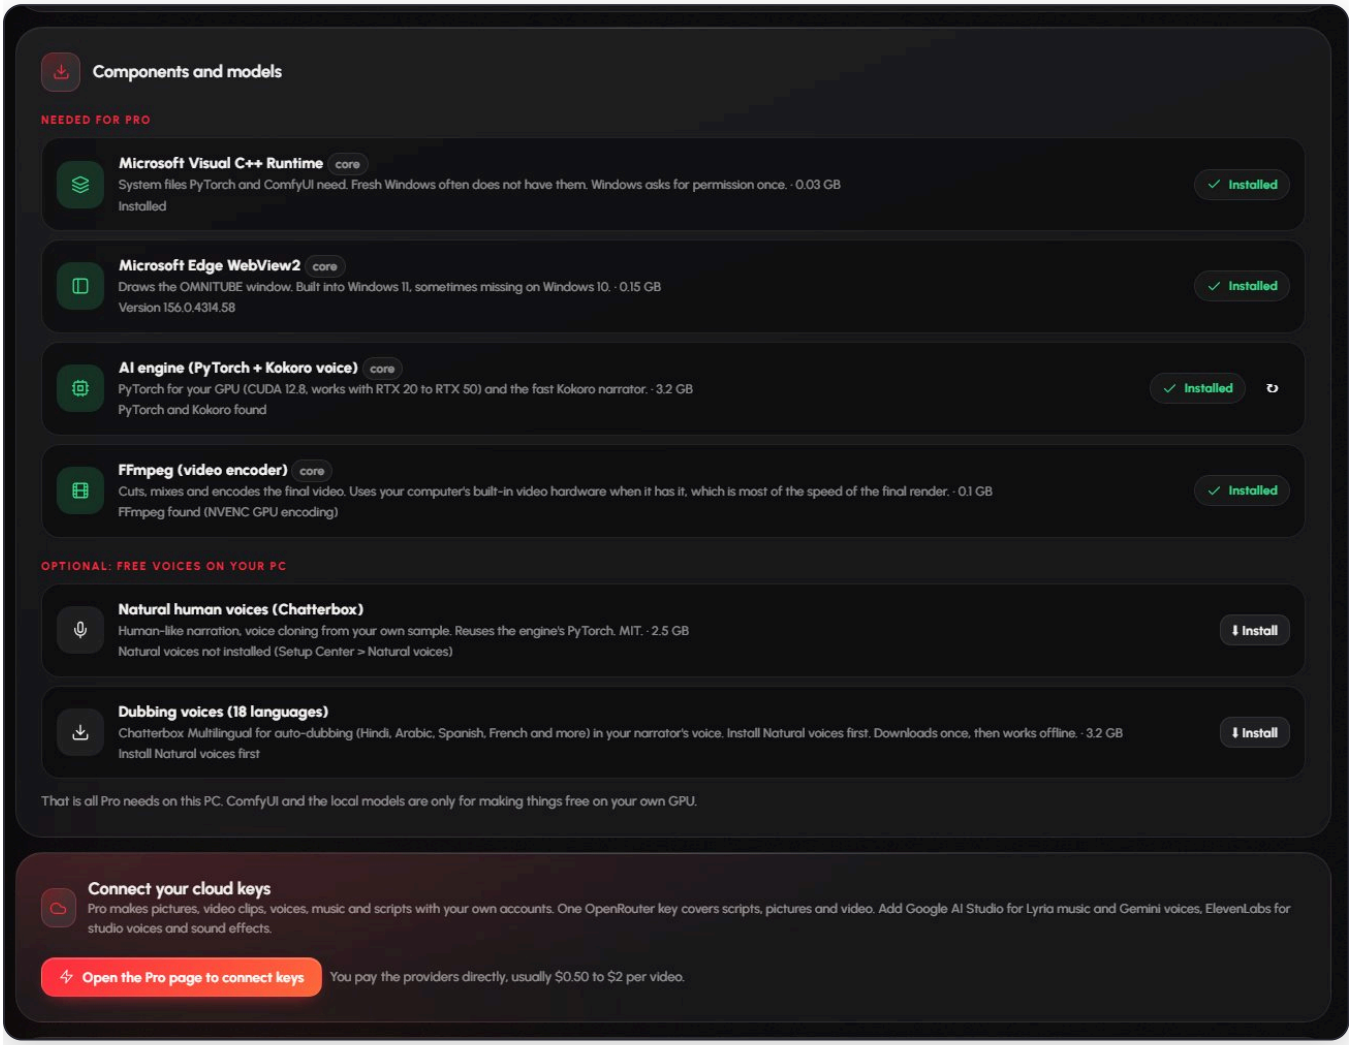

- List video types, styles (including My styles) and voices.
- Create a video from a script, list your videos and read a video's progress.
- Add characters, change the voice, speed, style, captions or watermark text.
- Estimate the cost, start a build (all steps or one step), stop a build and open the finished folder.

What Claude cannot do

- Work when OMNITUBE is closed.
- Spend money without asking: Claude asks before a cloud build because it costs money. Local builds are free.
- Connect accounts, enter keys, install components, edit single scenes on the Storyboard, make Shorts or dubs, or publish. Do these in OMNITUBE.

21

Setup Center

Components and models: each item shows if it is installed, with a one-click Install.

The cards

- **Free · On my PC** or **Pro · Cloud** at the top.
- A verdict card that says what your PC can do.
- **Auto setup**: downloads everything for this PC. It shows the items, the size and a time estimate. If you stop it, click **Continue**.
- **Your PC**: graphics card, processor, memory, free disk and whether it runs on GPU or CPU. **Auto-tune settings for this PC** picks the image size, video model and length that fit your GPU. **↻ Detect again** checks again.
- **ComfyUI**: already have ComfyUI? Click **Pick my ComfyUI folder** and OMNITUBE uses it and its models; nothing is downloaded twice. **Start ComfyUI** and **Start ComfyUI automatically when needed**.
- **Components and models**: every item with its size. **⬇ Install**, **⏸ Pause**, **Continue**, **↻ Retry**, and **↻** to check or repair an installed item.

- **Model Doctor**, **Help and repair**, **Where finished videos go** and **Style previews** (paint one real example for every style).

Components

Component	What it does	Size
Microsoft Visual C++ Runtime	System files PyTorch and ComfyUI need (Windows)	0.03 GB
Microsoft Edge WebView2	Draws the OMNITUBE window (Windows)	0.15 GB
NVIDIA graphics driver	Opens NVIDIA's download page	0.8 GB
AI engine (PyTorch + Kokoro voice)	PyTorch for your GPU and the fast Kokoro narrator	3.2 GB
FFmpeg (video encoder)	Cuts, mixes and encodes the final video	0.1 GB
ComfyUI	Runs the image and video models	2.0 GB
FLUX.2 Klein 4B	Default image model, fast and sharp	12.5 GB
FLUX.1 Schnell	Older, larger alternative image model	17.2 GB
Wan 2.2 5B	Turns scene images into 5 s clips, best for 8 to 16 GB GPUs	17.3 GB
Wan 2.2 14B FAST	Better motion, needs 32 GB system memory	36.0 GB
AI Music (ACE-Step 3.5B)	Background music on your PC	7.7 GB
Smart Director + Face describer (Ollama)	Camera shots, faces, titles, translation, local scripts	6.5 GB
Natural human voices (Chatterbox)	Human-like narration and cloning from your sample	2.5 GB
Dubbing voices (18 languages)	Auto-dubbing in your narrator's voice	3.2 GB

All models are open-license (Apache 2.0 or MIT).

Model Doctor

FLUX or Wan stuck, or "Error while deserializing header"? A model file is damaged. Click **Check my models**, then **Fix N problems**. The doctor moves the bad file aside and downloads a clean copy. **Delete moved files** frees the space afterwards.

Help and repair

- **Repair OMNITUBE** fixes most problems.
- **Create error report** saves a file on your Desktop. Send it in the OMNITUBE Discord.

22

Settings

Click **Settings** in the sidebar. Settings apply to new jobs. Use **Auto-tune** in Setup Center for the best values for your PC.

Group	What you set
Look & folders	**Theme** (Crimson, Matte, Ember) and the **Output folder** where finished videos are copied
Images (ComfyUI)	**ComfyUI URL**, **Image workflow**, **Image width**, **Image height**, **Timeout (s)**
Final video	**Width**, **Height**, **FPS**, **Encoder** (Auto, NVIDIA GPU, CPU), **Crossfade (s)**, **Motion strength (0 to 2)**, **Pause between scenes (s)**, **End silence (s)**, **Chapter titles on screen**, **Title font**
Video scenes (image to video)	**Video model workflow**, **Max clips chained per scene**, **When a clip ends before the narration** (hold the last frame with a slow zoom, or loop), width, height and frames (0 = default), **Negative prompt for video**, **Check models in ComfyUI**
Video shape	**16:9 YouTube**, **9:16 Shorts / Reels / TikTok**, **1:1 Instagram square** for new renders
Stock footage	**Pexels API key**, **Pixabay API key**
Audio	**Music volume (0 to 1)**, **Voice runs on** (Auto, GPU, CPU), natural voice emotion, pacing and variation, **Pause between sentences (s)**
Defaults for new videos	**Voice**, **Voice effect**, **Studio clean**
Backup	**Export settings**, **Import settings**, and **Sound and taskbar flash when a video is ready**

Click **Save** to keep changes. **Reset to recommended** puts image size, video size, clip length, encoder and voice device back to what suits your PC; your keys, folders and defaults are not touched.

> Tip: Video types adjust crossfades, pauses and music level on top of these settings. API keys are never included in an exported settings file.

23
Troubleshooting

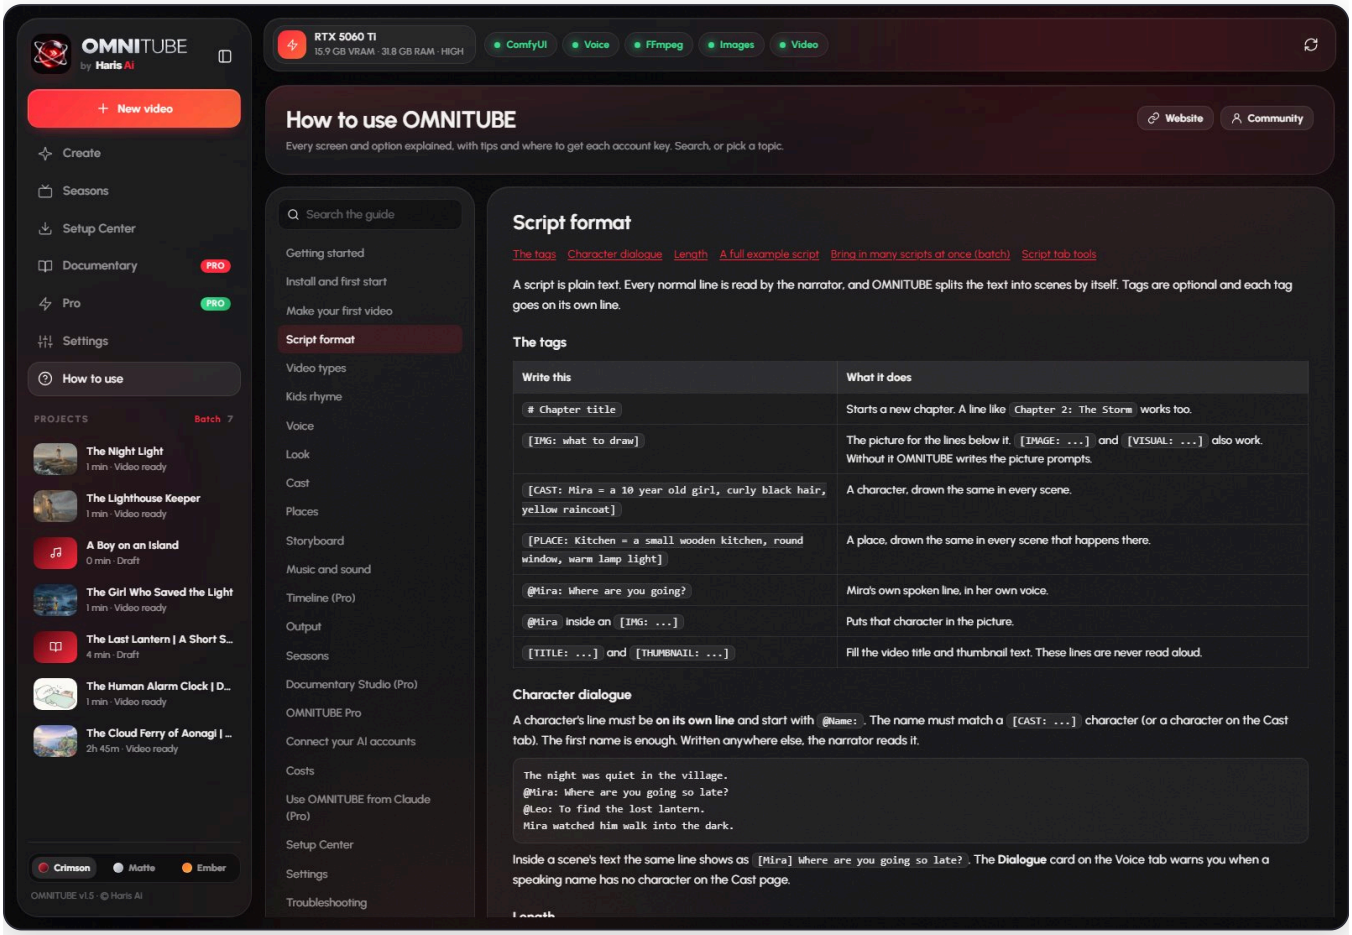

Problem	What to do
"No NVIDIA GPU: images and video will be slow" or "This PC has no NVIDIA graphics card"	Click **Switch to Cloud** on the Storyboard (Pro), or use stock footage. Voice, music and render still work.
"ComfyUI closed while working" or "This PC is low on memory"	Pictures and clips need about 16 GB of free memory while the model loads. The message names the program using the most memory (often a browser with many tabs). Close it or some tabs, then click **Resume**. Finished scenes are kept.
"A few things are still missing"	Click **Install now**, wait until the item shows **Installed**, then click the build button again.
"Voice preview can't run yet"	Open Setup Center and install the AI engine and FFmpeg.
"Natural voices are not installed yet"	Setup Center > Natural voices > Install, or pick a Kokoro voice.
"FFmpeg is missing"	Setup Center > FFmpeg > Install.
"Voice engine part missing"	Setup Center > AI engine > Install (repair).
"Sample is only X s"	Record 10 to 30 seconds of clear speech.
Edge voice blocked or not answering	OMNITUBE uses an offline Kokoro voice of the same language. Finished lines are kept. Try again later or pick a Kokoro voice.
FLUX or Wan stuck, "Error while deserializing header"	Setup Center > **Model Doctor** > **Check my models** > **Fix**.
"That folder does not look like ComfyUI"	Pick the folder that contains main.py.
"Port 7860 is busy"	Quit OMNITUBE fully (Cmd+Q on Mac), open it again and press Install.
A character speaks with the narrator's voice	Put the line on its own line starting with `@Name:` and make sure a character with that name is on the Cast page. Check Dialogue is not set to **One storyteller**.
A character looks different in every scene	Write a **Look** on the Cast card and make the character sheet.
A video scene shows no video	Make the image first: every video is animated from the scene image.
"Writing the script needs Smart Director"	Install Smart Director in Setup Center, or paste your own script.
Dub button is greyed out	Install **Natural voices** and **Smart Director** in Setup Center.

Problem	What to do
"The AI could not read the style of these pictures"	Start Smart Director, connect a cloud script AI, or write the style in words.
"That file is bigger than 15 MB" (logo)	Use a smaller logo file.
"A job is already running for this project"	Wait or click **Stop**. "The job is still stopping" means wait a few seconds.
A cloud build paused	It went 20% over the estimate. Check the cost, then **Resume**, or untick the 20% stop.
"Could not reach the OMNITUBE license server"	Check the internet and try again. Pro keeps working offline for up to 14 days.
"This version of OMNITUBE is too old for Pro"	Click the update button at the top and update.
"The Pro subscription has ended" or "This license was refunded"	Check your Gumroad purchase.
"OMNITUBE files were changed by another program"	Download OMNITUBE again from theharisai.com/omnitube and install it over this copy.
Not enough disk space	Free up space on the drive shown in **Your PC**, then **Auto setup** again.
Nothing helps	Setup Center > **Repair OMNITUBE**, then **Create error report** and send it in the OMNITUBE Discord.

> Tip: The **Log** under the progress bar shows every step of a build, including provider switches and voice fallbacks. Read it first when something looks wrong.

FAQ

The full guide is inside the app too: click How to use in the sidebar and search any topic.

Is the free version really free?

Yes. Everything runs on your PC with no subscription, no watermark and no minute limit.

Does OMNITUBE sell credits?

No. Pro uses your own API keys. You pay the providers directly and OMNITUBE adds nothing.

Do I need a powerful PC?

For free pictures and clips you need an NVIDIA card with 4 GB or more. With Pro, pictures and clips are made in the cloud, so any PC works.

Does it work on a Mac?

Yes, on Apple Silicon (M1 or newer) with macOS 12 or later. Pictures and clips come from the cloud (Pro) or stock footage. The Mac does voice, editing and rendering.

How long can a video be?

There is no minute limit. About 150 narrated words make 1 minute. Long videos take longer to build, so use **Preview first** and batch builds overnight.

Can I use my own voice?

Yes. Upload a 10 to 30 second sample in Voice Studio for a free natural voice, or clone your voice with ElevenLabs (Pro).

Can I use my own pictures, clips and music?

Yes. Upload a picture or clip on any scene, put music in `assets/music`, add your own sound folder, or drop files on the Pro Timeline.

Can characters speak with their own voices?

Yes. Write `@Name:` at the start of the line, on its own line, and pick the voices on the Cast page.

Can I move Pro to a new PC?

Yes. Activate the same key on the new PC. The first move works at once, then once every 30 days.

Are my keys safe?

Keys are saved only on your PC and sent only to their own provider. Exported settings never include keys.

Where do I get help?

Use Setup Center > **Help and repair**, create an error report and send it in the OMNITUBE Discord.

Need help?

Open **How to use** in the app, or Setup Center > **Repair OMNITUBE**.
Pro buyers: WhatsApp +92 348 5563133 with the code "Omni Pro".
